1.2. Glossary of key terms (A to Z)¹

“**calculated direct net cost**” means the final direct net cost figure that, in TERA’s view and following TERA’s assessment, should be allowed for the purposes of this application. The term may be used to describe either the calculated direct net cost for an individual USO model, or the total calculated direct net cost, as the context requires.

“**direct net cost**” of USO is the difference between the avoidable costs attributable to the provision of the USO (both direct and indirect), minus revenues (both direct and

¹ Save where specified above, terms and abbreviations used by TERA in this report have the same meaning as those listed in the Glossary of D04/11.

indirect) attributable to the provision of the USO, before the deduction of intangible benefits which accrue to the USP by virtue of being the USP.

“final 2014/15 USO funding application” is eir’s revised USO funding application for the financial year 2014/15 submitted to ComReg in July 2016.

“Frontier Report” means the final report prepared by Frontier, “USO Model Documentation - 2014/15, A Report prepared for Eir, July 2016”, outlining eir’s calculations and methodology for the direct net cost for the financial year 2014/15, together with the Frontier report outlining additional changes to the USO Model, as submitted to ComReg in July 2016.

“Frontier Supplemental Report” is the report prepared by Frontier Economics, “Response to ComReg questions on Eir’s 2010/11 USO funding applications, ‘A report prepared for Eir’, February 2015”.

“initial 2014/15 USO funding application” is eir’s initial USO funding application for the financial year 2014/15, submitted to ComReg in March 2016.

“MDF area” means a geographic area as described by the Market Distribution Frame map.

“net cost” is calculated as the difference between the ‘direct net cost’ and the intangible benefits which accrue to the USP, by virtue of being the USP.

“USO Model” refers to the USO direct net cost model underpinning eir’s USO funding applications to ComReg as a whole, including all calculations, data, spreadsheets, the model summary and the individual net cost models (Area, Customer, Payphone, Directories, and Disabled Users). These individual direct net cost models may be referred to cumulatively as “USO Models”.

2. Executive summary

TERA Consultants (“TERA”) were engaged by ComReg to undertake an assessment of the direct net cost element of Eircom Limited’s (“eir’s”) USO funding application for the financial year 2014/15 and to assess its adherence with the direct net cost calculation principles and methodology set out in ComReg Decision D04/11².

TERA’s “Assessment of Eir’s USO funding application – Direct net cost 2014-2015, March 2019” is an updated version of TERA’s report of March 2018³ (the “March 2018 TERA Report”).

Following the publication by ComReg on 30 April 2018 of ComReg Consultation and Draft Determination titled “Assessment of eir’s 2014 – 2015 Universal Service Fund Application”, to which the March 2018 TERA Report was appended, ComReg asked TERA to reconsider the USO Payphone Model and, in particular, the removals policy in ComReg Decision D08/14 in light of submissions made by Eir. In the March 2018 TERA Report, TERA based its analysis on the view that, from January 2015, the earliest that Eir could remove any public payphone was 6 weeks, and TERA made an adjustment to the Payphone Model on this basis. ComReg has advised TERA that Eir in its submissions in response to consultation said that, post January 2015, the earliest it could have removed a public payphone was 8 weeks as the notification requirements in D08/14 require Eir to give 8 weeks notice of the removal of a payphone.

TERA outlined in the March 2018 TERA Report that its analysis showed that the direct net cost of ✂ payphones (out of the ✂ claimed by eir) was avoidable in 2014/15 and was not allowable as part of the direct net cost in the Payphone Model. TERA’s view was that as these payphones could have been removed by Eir, the cost did not constitute a USO direct net cost. TERA had therefore discounted the net cost related to these ✂ payphones by reference to the number of months during which the payphones could have been removed. In the March 2018 TERA Report, TERA based this calculation on a 6 week removal period. In light of Eir’s submissions, ComReg requested TERA to carry out this analysis again using an 8 week removal period.

In the March 2018 TERA Report, TERA applied an adjustment of €80,049 to the Payphone Model to take account of D08/14, on the basis of a 6 week removal period. Having carried out this analysis on the basis of an 8 week removal period, the necessary adjustment is €72,456. Applying this adjustment of €72,456, the calculated direct net cost of the Payphone Model is now €129,650.

In this updated report, the March 2018 TERA Report has been set out in full again. The changes that have been made in this updated version, and which are reflected throughout this updated report are as follows:

² Decision D04/11, ‘Decision on the costing of universal service obligations: Principles and Methodologies’, 31 May 2011 (hereinafter “D04/11”)

³ “Assessment of Eir’s USO funding application – Direct net cost 2014-2015”

- adjustment to the earliest timeframe in which eir could have removed a public payphone after January 2015 from 6 weeks to 8 weeks;
- application of an adjustment of €72,456 to the Payphone Model
- consequent amendment of the calculated direct net cost in the Payphone Model to €129,650; and
- consequent upward adjustment of the total direct net cost from €12,263,277 to €12,270,870.

TERA's assessment of eir's final 2014/15 USO funding application, including any required adjustments to the USO model is that the calculated direct net cost is €12.27M. This is based on the figures within eir's USO Model submitted in July 2016, adjusted by TERA where necessary (see further below).

2.1. Background

- eir's application for USO funding for the financial year 2014/15 was initially submitted on 31 March 2016, including the USO Model and a report prepared by Frontier Economics ("Frontier") outlining eir's methodology and calculations for the direct net cost. This entire application is referred to as eir's ***"initial 2014/15 USO funding application"***.
- During 2015 and 2016, there was a process of engagement between eir and ComReg in relation to the USO Model and TERA advised ComReg on certain clarifications required from eir. Frontier assisted eir to respond to these clarifications. Following a workshop with eir, Frontier, TERA and ComReg in February 2015, eir submitted a supplemental report prepared by Frontier containing responses to ComReg's questions (the ***"Frontier Supplemental Report"***⁴).
- As a result of this clarifications process, eir made certain adjustments to its USO model and ultimately submitted a USO funding application for the financial year 2014/15 to ComReg in July 2016, with a direct net cost claim reduced by approximately €2.25M, from an initial €15.53M to €13.28M. This revised application is referred to as eir's ***"final 2014/15 USO funding application."***
- eir's final 2014/15 USO funding application includes the USO Model and two Frontier Reports submitted in July 2016; a general Frontier report outlining eir's methodology and calculations for the direct net cost and a separate Frontier report describing all USO Model changes since eir's initial 2014/15 USO funding

⁴ The Frontier Supplemental Report was prepared in response to ComReg's questions on eir's 2010/11 USO funding application, however, those responses are also considered by TERA in this report (2014/15) because eir's file "Overview of application and documentation 1415 _July 2016 submission.pdf" stated that *"...The specific methodology used for this funding application is consistent with the methodology underpinning eir's revised USO funding claims for the financial years ended June 2011 to June 2014, which have been submitted alongside this funding claim for the year ended 2015"*. and used largely the same methodology in both applications.

application (these Frontier reports are referred to jointly as the “**Frontier Report**”).

2.2. TERA’s assessment

TERA has reviewed PWC’s Agreed Upon Procedures (“AUP”) Report⁵, and all aspects of eir’s initial 2014/15 USO funding application and its final 2014/15 USO funding application. This involved a detailed review by TERA of the data sources, methodology and calculations in eir’s USO model. The details of TERA’s assessment process are set out in chapter 3, Methodological Overview.

The direct net cost figures claimed by eir under each of the individual USO models are summarised in Table 1 below. eir has also claimed an amount for consultancy fees.

Table 1 2014/2015 - USO Direct Net Cost

Net cost component, €	2014/2015	2014/2015	2014/2015
	Initial eir application	Final eir application	Final assessment as validated by TERA
Area Model	311 027	311 027	311 027
Customer Model	13 187 149	10 919 705	10 391 360
Payphone Model	320 223	320 223	129 650
Directories Model	1 400 000	1 400 000	1 400 000
Disabled Users' Services Model	38 833	38 833	38 833
Consultancy fees	269 227	291 369	-
Total direct net cost	15 526 458	13 281 157	12 270 870

Source: USO Model Summary, July 2016

As a result of the process of engagement between eir and ComReg in relation to eir’s applications, eir implemented one main methodological change to its final 2014/15 USO funding application as follows:

- eir has made a methodological change to the allocation of repair access costs based on a two-step approach, using both (i) the number of staff; and (ii) LFI, as allocation keys, which TERA considers to be more in line with the 2009 CAM.

Separate and distinct from the process of engagement between eir and ComReg, eir implemented a second main methodological change to its final 2014/15 USO funding application as follows:

⁵ PwC – “Report of factual findings in connection with eircom’s application for funding in respect of the universal service obligation for the year ended 30 June 2015 (“the USO Funding Application”) in compliance with D04/11 Decision 22”.

- eir used the 2016 CAM to produce cost avoidability inputs in the Customer Model. These refer, in particular to (a) border of the housing area and (b) the split of costs (capex) between housing areas and isolated areas by underground/overhead network.
- eir used the 2009 CAM to calculate the level of avoidability of capex within isolated areas.
- TERA considers eir’s use of the 2016 CAM in its 2014/15 USO funding application is inappropriate, and in particular, its mixed use with elements of the 2009 CAM is incorrect. TERA notes in particular that eir’s allocation of costs based on the “urban/rural” classifications in the 2016 CAM to the “housing/isolated areas” classifications in the 2009 CAM, is incorrect as these two classifications are not the same and are not directly substitutable.
- TERA considers that eir should have used solely the 2009 CAM for its 2014/15 funding application. The 2016 CAM was not finalised until May 2016. eir’s initial 2014/15 USO funding application was made in March 2016.
- TERA has taken eir’s 2013/14 Customer Model “allocation key” inputs and calculations, based on the 2009 CAM and applied these to eir’s 2014/15 Customer Model worksheets (*I_Cost_Allocand I_Assumptions*), Using this methodology TERA has estimated that required downward adjustment to the direct net cost of eir’s 2014/15 Customer Model is circa €528,345. Accordingly the Customer Model has been adjusted to reflect this.

Table 1 illustrates that in eir’s initial 2014/15 USO funding application it claimed a direct net cost of € 15.53M. Following the above adjustments and a series of other adjustments to the USO Models, eir’s final 2014/15 USO funding application claimed a reduced direct net cost of €12.27M.

2.3. Calculated direct net cost

TERA’s assessment concludes that the calculated direct net cost is approximately €1.02M lower than the final direct net cost figure claimed by eir, at **€12.27M**. TERA’s assessment can be broken down as follows:

1. **The calculated direct net cost of the Area Model is €311,027.** The Area Model demonstrates that about $\frac{1}{3}$ of MDF areas⁶ appear to be entirely uneconomic while $\frac{1}{3}$ of MDF’s appear to be entirely economic (on a revenue less costs basis). $\frac{1}{3}$ of MDFs contain *some level* of uneconomic customers⁷ but TERA notes that the number of uneconomic customers as a percentage of total customers in each economic MDF is low.

⁶ From a base of 1,064 MDFs

⁷ MDFs are either entirely uneconomic or only some of the customers in the MDF are uneconomic. (i.e. it contains economic and uneconomic customers).

2. **The calculated direct net cost of the Customer Model** (Uneconomic customers in economic areas) **is €10,391,360**. This constitutes 85% of the total direct net cost, which highlights the need for particular focus on the Customer Model and its methodological approach. This includes an adjustment made by Tera in light of the incorrect use of the 2016 CAM by eir.
3. **The calculated direct net cost of the Payphone Model is €129,650**. TERA made an adjustment to the Payphone Model in eir's final 2014/15 USO funding application to include advertisement revenues in the direct net cost estimate. A further adjustment is also made to these costs in order to not take into account the direct net cost of Payphones that eir did not have to continue to provide following the change in ComReg's "Removal Policy" that was revised in July 2014⁸. TERA, having re-considered the notification requirements set out in D08/14⁹ at the request of ComReg, has in March 2019 made a further adjustment to the Payphone Model following which the adjusted calculated direct net cost is €129,650.
4. **The calculated direct net cost of the Directories Model is €1,400,000**.
5. **The calculated direct net cost of the Disabled Users' Services Model is €38,833**.

The calculated direct net cost does not include the cost of consultancy fees claimed by eir (€0.29M). This is based on the reasoning and principles set out in ComReg's Decision D04/11.

TERA's assessment is that:

- **the calculated direct net cost is €12.27M;**
- **the calculation of the calculated direct net cost is accurate; and**
- **the calculations and methodology for the calculated direct net cost are in accordance with D04/11.**

2.4. Outline structure of TERA's report

The remainder of this report is structured as follows:

- **Section 3** - Methodological overview
- **Section 4** - Assessment of the treatment of revenue data, including:

⁸ Decision D08/14, File ComReg 14/69, July 7th 2014

⁹ "Universal Service – Provision of Public Payphones: Review of Usage Threshold for Removals" ComReg Document No.16/43, Decision 08/14.

- Assessing which categories of revenues are relevant and how revenues are allocated.
- **Section 5** - Assessment of the treatment of costs, including:
 - Assessing which categories of costs are relevant, how they are allocated, which costs are avoidable and which are distance sensitive.
- **Sections 6 – 10** - Assessment of the methodology and review of the calculation of the direct net cost in each part of the USO Model as follows:
 - Area Model – uneconomic MDF areas
 - Customer Model – uneconomic customers in economic MDF areas
 - Payphone Model – uneconomic payphones
 - Directories Model – directory services
 - Disabled Users' Services Model – services to disabled users

Section 11: Assessment of any overlaps between estimates of the direct net costs in the USO Model with estimates of the benefits in the intangible benefits model (Enhanced brand recognition, Ubiquity, Life cycle benefits, Marketing benefits).

3. Methodological overview

This report summarises TERA's assessment of eir's final 2014/15 USO funding application. It includes a description of all tasks performed by TERA for the assessment of eir's methodology and subsequent calculation of the direct net cost of each individual USO model, and a summary of TERA's analysis of potential overlaps with the intangible benefits model.

As part of TERA's assessment, TERA reviewed eir's initial 2014/15 USO funding application and its final 2014/15 USO funding application for consistency with the principles, methodologies and calculations for the direct net cost as set out in D04/11, in particular with Decisions 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 16, 17, 18, 25, 27, 29 and 36 of D04/11 (see Appendix 1, Section 12 of this report for all Decisions 1 to 36).¹⁰ TERA's assessment followed the below general approach:

- **Step 1** - Review of the Agreed Upon Procedures ("AUP") Report¹¹ provided by PwC as per Decision 22 of D04/11. The AUP report summarises the procedures and checks performed by PwC on eir's cost and revenue input figures, including a comparison of the values in the USO Model input sheets back to eir's source workbooks and a reconciliation of the USO Model to the HCA regulatory accounts. TERA confirmed that the scope of the AUP report covers the agreed in scope USO Model inputs and contains the appropriate level of revenue and cost detail. This also involved a detailed review by TERA of the data sources, methodology and calculations in eir's USO model.

¹⁰ As a number of the individual Decisions within D04/11 are either matters for ComReg or are of a general nature (such as those relating to the format, timing or supporting documentation required for the USO funding application), while TERA was cognisant of such decisions, they are not directly analysed in this report.

¹¹ PwC – "Report of factual findings in connection with eircom's application for funding in respect of the universal service obligation for the year ended 30 June 2015 ("the USO Funding Application") in compliance with D04/11 Decision 22".

- **Step 2** - Gained an understanding of eir’s approach to, and calculation of, the foregone revenue and avoidable operational expenditure (“OPEX”) and capital expenditure (“CAPEX”) costs data. In doing so, TERA had regard to the origination, interpretation and use of call volume data, and also took account of geographic allocations and efficiencies, and in particular, Decisions 1 to 9 of D04/11.
- **Step 3** - Assessment of eir’s methodology and subsequent calculation of the direct net cost of each part of the USO model, in terms of ensuring that data is classified correctly, processing revenue and cost data, estimating the calculated direct net costs in uneconomic areas and of uneconomic customers in economic areas, as well as the calculated direct net cost of other USO services (Payphones, Directories etc.). As part of this assessment, TERA primarily considered methodology changes against eir’s final 2009/10 USO funding application given that eir’s 2013/14 USO funding application is subject to ongoing consultation. TERA has, however, also noted in this report changes in the methodology used between eir’s final 2013/14 and its final 2014/15 USO funding applications.
- TERA also considered whether its previous recommendations, which arose from TERA’s assessment of eir’s 2009/10 USO funding application (and were in existence at the time eir’s final 2014/15 USO application was submitted), were taken into account and, where feasible, implemented.
- The Decisions relevant to the particular USO models are:
 - Area Model: Decision 11, Decision 12.
 - Customer Model: Decision 10, Decision 12, Decision 13, Decision 14 and Decision 25.
 - Payphone Model: Decision 16 and Decision 27.
 - Directories Model: Decision 17.
 - Services for Disabled Users Model: Decision 18.

Two versions of ComReg’s copper access network cost model (“CAM”) have been used during the assessment to compare changes in eir’s final USO model (as outlined in section 7.2.3) against eir’s initial application:

- The 2009 CAM: This is the recommended version to be used in all calculations of the 2014/15 direct net cost within the USO Model, for historical consistency as the 2009 CAM was in place at the time eir incurred the costs and revenues that are the subject of this application¹².

¹² 2009 CAM was dimensioned to calculate copper access services costs and inventories for the period 2007 to 2013.

- The revised version of the CAM developed in 2016 (the “2016 CAM”)¹³: This version is used for all TERA’s cross checks of geographical cost allocations as it is based on the most current and granular information provided by eir in relation to its network, and hence better reflects the actual network costs incurred.

eir has used a mixture of the 2009 CAM and the 2016 CAM in its 2014/15 USO Customer Model.

eir has used the 2016 CAM model to produce the cost avoidability inputs it has used in the 2014/15 USO Customer Model. These refer, in particular, to (a) the border of the housing area and (b) the split of costs (capex) between housing areas and isolated areas, by underground/overhead network.

eir has used the 2009 CAM (maintained at the FY 2013/14 level) to calculate the level of avoidability of capex within isolated areas.

eir’s final 2014/15 USO funding application documents, did not provide an explanation or rationale for eir’s use of the 2016 CAM.

TERA considers that eir’s use of the 2016 CAM in its 2014/15 USO funding application is inappropriate, and in particular, its mixed use with elements of the 2009 CAM is incorrect. TERA notes in particular that eir’s allocation of costs based on the “Urban/Rural” classifications in the 2016 CAM to the “Housing /Isolated Areas” classifications in the 2009 CAM, is incorrect as these two classifications are not the same and are not directly substitutable.

- As part of the Step 3 assessment, the 2016 CAM is used by TERA as a cross check to ensure that there is consistency in the application of network design rules. (i.e. that the same design rules are consistently applied, to avoid cherry picking or modelling of less favourable approaches).
- **Step 4** - TERA analysed and identified any potential overlaps with and double-counting between the USO direct net cost model and the intangible benefits model as per Decision 36. TERA considered whether eir’s final 2014/15 USO funding application is acceptable overall from a technical standpoint (e.g. technological choices, dimensioning and planning, etc.) and economic perspective (e.g. cost allocation choices, cost standards, etc.).

Furthermore, once all methodological changes were reviewed, in order to assess any input based changes and to quantify their impact on the final calculated direct net cost, TERA compared the final 2014/15 direct net cost results with the 2013/14 direct net cost results by comparing both the main inputs (revenues and costs incurred) and the total net cost calculated by the two models. It should be noted that any references to 2013/14 direct net cost results are for comparison purposes only.

TERA’s key conclusions are summarised within text boxes throughout this report.

¹³ The Revised CAM published in 2016 - a bottom up model developed by TERA for ComReg which is used to determine wholesale access prices.

4. Revenue data

4.1. Section Overview

Revenue data consists of both direct and indirect revenues as outlined in D04/11, Decision 2, Decision 3, Decision 4, Decision 5, Decision 6 and Decision 7. In summary:

- Decision 2 sets out the basis for calculating avoidable costs relevant to the calculation of the direct net cost
- Decision 3 sets out the basis for calculating USO revenues related to these costs.
- Decisions 4 and 5 set out the scope of direct revenues to be included in the USO models
- Decision 6 sets out the scope of indirect revenues to be included in the USO models
- Decision 7 sets out the basis upon which the USP may use an alternative approach for the calculation of indirect revenues.

The full text of these decisions is listed below (and in Appendix 1, Section 12 of this report):

Decision 6: *Indirect revenues shall include those revenues which are not directly invoiced to a customer for the services provided directly by the USP. They include:*

- *Wholesale interconnection revenues: fixed termination and transit services as a result of inbound calls from another fixed / mobile networks, where an OAO is invoiced for terminating and transiting a call on the USP network;*
- *Non-geographic numbers (e.g. 1800, 1850, 11811 and 1890 numbers);*
- *Economic USO customer calls to an uneconomic customer: firstly, the revenue of the economic customers' calls to uneconomic customers shall be allocated to the uneconomic customer. If the uneconomic customer is now economic, as result of the allocation, then a second stage is required to ensure that this treatment does not make the previously economic customer into an uneconomic customer as a result. If as a result of this second stage the economic customer becomes uneconomic, then it is only that portion of revenue which the economic customer can spare without making themselves uneconomic that should be allocated;*
- *Leased Lines: where initially all revenues associated with the leased line are allocated to the uneconomic line. If the uneconomic point is now economic, as a result of the allocation, then a second stage is required to ensure that this treatment does not make the previously economic point into an uneconomic point as a result. If as a result of this second stage the economic point becomes uneconomic, then it is only that portion of revenue which the economic point can spare without making themselves uneconomic should be allocated; and*
- *Replacement calls: where a net cost exists, replacement calls shall be estimated and added to the net cost calculation (but only in circumstances where "uneconomic" areas or customers have been firstly identified as commercially uneconomic).*

Decision 7: *Where it is clearly demonstrated that due to a lack of information beyond the control of the USP, that it is not practicable for indirect revenues to be calculated in accordance with Decision No. 6, the USP may use an alternative approach, provided that it is properly supported with reasonable assumptions.*

The revenue data is sourced from eir's corporate data warehouse and includes revenues from connections, rentals, calls and other revenues.

This section assesses the treatment of the revenue data in terms of which categories of revenues are relevant for inclusion in /exclusion from the direct net cost calculation and how they are allocated (what share of total revenues is to be attributed to a specific MDF or customer, and in what time perspective (i.e. allocation of costs over time). It is structured as follows:

- Revenue scope
 - Excluded revenue data
 - Included revenue data
- Revenue data allocation
 - Allocation of revenues to MDFs
 - Allocation of one-off revenues
 - Methodological change - Working line definition
- Conclusion

4.2. Revenue Scope

4.2.1. Excluded Revenue Data

eir's initial 2014/15 USO funding application excluded certain revenues from the scope of the direct net cost estimation for a number of different reasons (e.g. the corresponding services are not based on the copper network; the revenues are not intrinsic to any specific MDF; unavailable data; immaterial value; or revenue that is not generated from eir lines).

TERA notes that eir has made several changes to the revenue data treatment aimed at improving the net cost model. These changes partially explain the changes in the model results.

TERA has checked the reasonableness of eir's 2014/15 exclusion of each of the revenue categories, with eir's 2009/10 USO funding application revenue exclusions. TERA has also checked any revenue category changes in 2014/15 with those excluded in eir's 2013/14 USO funding application.

TERA, in eir's 2009/10 USO funding application, considered that the exclusion criteria for 3 of 45 excluded revenue elements (National Freefone, International Freefone and Interconnect Links) were unclear. While TERA considered that it was acceptable for the 2009/10 USO funding application as these revenue elements constituted only 8% of the total revenue and the possible impact on the net cost would have been marginal, TERA

sought further clarification from eir regarding its reasoning for future submissions. This further rationale was provided in eir's initial 2014/15 USO funding application, which TERA notes is consistent with eir's approach in its final 2013/14 USO funding application.

In relation to the first two revenue types, National Freefone and International Freefone services, the services are first described below and then eir's rationale for their exclusion is set out:

1. National Freefone

National Freefone is a short number service (1800, 1850 or 1890 numbers) that allows special pricing, whereby the receiving party fully or partially pays for the cost of the call. This National Freefone service operates with calls from eir's network, from a fixed-line OAO¹⁴ or from a mobile operator.

2. International Freefone

International Freefone service allows calls from abroad. International Freefone revenues correspond to charges paid by hosted retail operators of freefone numbers, including one-off connection charges, fixed access charges and traffic based charges.

eir's rationale for excluding part of the National and International Freefone revenues is as follows:

- Part of the Freefone (National and International) revenues may be lost if the MDF where a Freefone call is terminated is disconnected. National Freefone revenues may also decrease if the MDF supporting the associated call origination is disconnected.
- To take account of this eir has checked whether the MDFs where freefone calls (National and International) are terminated, are generally MDF's classed as large economic exchanges, or whether they are uneconomic MDF's (which absent the USO, eir could choose to disconnect). To test this, a sample of 750 freefone calls (terminating on eir's fixed network) were checked. eir concluded that $\frac{1}{4}$ of the corresponding MDFs belonged to the top quartile¹⁵ of MDFs in terms of the number of lines¹⁶.

eir did not exclude all of the Freefone revenues – it only excluded the connection and fixed access revenues (because they are located in large MDFs that were proven to be less likely unprofitable).

eir did not exclude other traffic-based revenues associated with calls originating/terminating on eir's network.

¹⁴ Other Authorised Operator

¹⁵ The top quartile refers to MDFs ranked by size (based on the number of lines). In this instance, $\frac{1}{4}$ of Freephone calls are terminating within the top 25% MDFs within eir's network.

¹⁶ Frontier Supplemental Report.

TERA's view is that eir has justified its exclusion of parts of the National and International Freefone revenues from the USO Models. Based on eir's sampling of Freefone calls, Freefone revenues appear unlikely to be significantly impacted if eir was to disconnect an uneconomic MDF as the bulk of Freefone revenues are more closely linked to large economic MDF's, which absent the USO, eir would not choose to remove from its network.

TERA concludes that the revenues categories (not including traffic revenues):

- **International Freefone; and**
- **National Freefone,**

were excluded on reasonable grounds for the purpose of the USO direct net cost calculation, as only revenues related to large MDFs that are less likely to be uneconomic were excluded.

3. Interconnect Links

Interconnect Links are high capacity transport links, interconnecting eir with carrier pre-select operators, the largest of whom is BT. eir explain that all the OAOs, except BT, are interconnected at a high level in the network while a significant proportion of BT's interconnection points are at tertiary exchange level.

eir considers that much of this traffic originates or terminates with mobile operators, and therefore it is not relevant to the USO revenue data. eir considers it is unlikely that Interconnect MDFs (supporting primary, tandem and double tandem interconnection) are located within uneconomic areas.

The demand for high-capacity links is unlikely to be impacted by the disconnection of some areas and/or end users disconnections. As a result only a significant change in the volume of traffic will result in a reduction in the number of interconnect voice circuits.

TERA concludes that the revenues category Interconnect links was excluded on reasonable grounds for the purpose of the USO direct net cost calculation, as they are only linked to large MDFs that are less likely to be uneconomic.

TERA also considered the exclusion criteria for the remaining 42 excluded revenue elements. These excluded revenue elements may be summarised into the following five categories; non-USO services; large MDF based services; non MDF specific services; competitive services; not relying on legacy copper loop. As the rationale for the exclusion of these five revenues categories was unclear in eir's initial 2014/15 USO funding application, TERA sought further clarification from eir regarding its reasoning, which was provided in eir's final 2014/15 USO funding application.

eir's rationale is set out in more detail below:

1. Non USO services

eir consider it is possible to exclude the services that are not a part of USO on the condition that both the associated eir costs and eir revenues are excluded.

Fibre leased lines are not a part of the USO, therefore eir revenues and corresponding fibre costs and civil works are excluded.

'All ISS¹⁷ revenue' are associated to access to Internet and are therefore excluded.

2. Large MDF based services

eir considers that large MDFs are likely to be economic and the exclusion of revenue and costs linked to these MDFs does not change the resulting net cost. Therefore, the following services linked to large MDFs and delivered by way of core network fibre are excluded from the net cost calculation:

- Leased lines: as they are either delivered by way of fibre or are international leased lines and they are linked to large urban MDFs and therefore unlikely to be uneconomic. TERA notes that this equals \times in excluded revenues.
- Ancillary products: this category includes mainly wholesale revenues from access to Eir 1850/90, access to OAO (Other Authorised Operators) 1800 numbers and access to Universal Access numbers. These calls do not originate in any particular MDF, and called numbers are likely to be located in larger MDFs. TERA notes that this equals \times in excluded revenues.
- 'Co-location' services: as their revenues could not be easily allocated to MDFs and in practice are located in larger, economic MDFs. TERA notes that this equals \times in excluded revenues.
- Property services: their revenues are only associated with office buildings and some large Dublin MDFs. TERA notes that this equals \times in excluded revenues.

3. Non MDF specific services

eir considers that some categories of eir's services are not associated with any particular MDF. The corresponding revenues would not therefore change if an uneconomic MDF is removed.

Repayable works orders and wholesale managed services (relating to white label services) are not associated with any specific MDF and have therefore been excluded.

4. Competitive services

eir considers that revenue from apparatus supply is the revenue associated with corporate equipment, which is provided in competitive conditions, it is not a part of USO and therefore is excluded.

¹⁷ ISS: Internet Supply Services: Value added internet dependent – not intrinsic at a customer/exchange level- revenues not dependent on the customer base. As opposed to conveyance of dial-up internet traffic.

5. Services not reliant on copper loop

eir considers that revenue of services delivered by way of the core network fibre (such as VOIP) and do not rely on the copper loop (such as FTTH) are not included in its direct net cost as these services are provided by eir on commercial basis.

In relation to the above five revenue categories TERA concludes that it is reasonable to exclude these revenues based on the following rationale:

- (1) As the service is not within the scope of USO (and is provided by eir on a commercial basis); or
- (2) As the service is highly likely to be profitable (and as a consequence would not lead to any change in the net cost calculation).

For the above reasons TERA considers that eir's rationale for exclusion of these 4 revenue categories is reasonable and that they can be excluded from the USO model.

4.3. Revenue data allocation

4.3.1. Allocation of revenues to MDFs

TERA is of the view that the allocation of revenues to MDFs is properly performed for 2014/15 and is in accordance with the requirements of Decision 6 and Decision 7 of D04/11. TERA notes that for 2014/15, revenue data for the all 12 months of the financial year was provided by eir. This is in line with ComReg's recommendations in Consultation D13/45 and in Decision D01/14¹⁸ that complete indirect revenue data should be provided.

4.3.2. Allocation of one-off revenues

Decision 4 sets out the scope of direct revenues to be included in the USO models:

¹⁸ ComReg Document 13/45: Consultation and Draft Determination on the Assessment of Eircom's Universal Service Fund Application for 2009-2010, section 4.3.2; and ComReg Document 14/03, Decision D01/14: Assessment of Eircom's Universal Service Fund Application for 2009-2010– Response to Consultation and Determination, section 4.14.

Decision 4: Direct revenues shall include those revenues which are directly invoiced to a customer for the services provided directly by the USP. They include:

- One-off connection charges: where the revenue should be allocated over the expected life of the customer. In circumstances where a line is permanently disconnected, the remaining unallocated one-off connection charges should be allocated to that year of disconnection;
- Revenues associated with access (e.g. line rental);
- Calls (e.g. local, national, mobile, international, directory enquiries (“DQ”) and premium rate services); and
- Complementary services, such as, broadband services.

In accordance with Decision 4, eir, in its final 2014/15 USO funding application allocated all the one-off revenue categories to the year in which they were incurred¹⁹, except PSTN connections which were recognised in the same period as the initial connection, without amortization (see Table 2). The PSTN connection charges are offset by the corresponding costs, which are treated in a similar manner. eir explain that the margin of the PSTN connection service is close to zero.

Table 2. Time allocation of one-off revenues

One-off revenue category	TERA's 2014/15 assessment
RAT connection revenues	Amortised over customer lifetime ²⁰ in the Area Model
PSTN connections	Not amortised
Other one-off revenues	Amortised over customer lifetime

Source: TERA analysis

eir states that all the connection revenues (excluding RAT and PSTN) are already amortised within the regulatory accounts, over expected customer lifetime²¹. Thus regulatory amortisation is already incorporated within the USO model input data.

RAT connection revenues are not amortised within the regulatory accounts. The RAT connection revenues are however amortised within the Area Model, over a ~~3~~ lifetime of a customer. The PSTN connection cost was not included in the amortisation. As the treatment for costs is similar to the treatment of revenues, this approach is acceptable.

TERA considers that this treatment of one off revenues is acceptable and in line with Decision 4 of D04/11.

¹⁹ Frontier Report page 14

²⁰ Not amortised in regulatory accounts but is amortised in Area Model over a ~~3~~ customer lifetime.

²¹ Frontier Supplemental Report, Page 8

4.3.3. Methodological Change - working line definition

eir has made several changes to the definition of working lines in its final 2014/15 USO funding application compared to the initial application. eir provided the following rationale for these changes:

- SABB²² and supplementary service lines categories were added in the physical line count.
- Particular categories of lines were either included or excluded from the USO model to ensure that the model only includes lines for which the associated revenues and costs are included. These changes are summarized in the table below:

Table 3. Working Line Definition

Service	Inclusion	Exclusion
PSTN	<ul style="list-style-type: none"> • ISDN PRA/FRA lines (over fibre) • POTS-based retail FTTC lines 	WiFiHub lines
WLR	WLR ISDN PRA/FRA lines (over fibre)	-
Leased Lines	PPC End User Links (>155mb)	International Private Circuits NGN WSEA and NGN (multi-service access) retail lines Fibre-based National Private Circuits (2Mb)
Supplementary	National Ethernet Lines	Mobile Backhaul lines Fibre-based Business IP lines

Source: Frontier Report, "Additional model changes for eir's re-submitted USO funding applications for 2010/11 to 2014/15, dated July 2016"

The line length distribution has been updated accordingly: the length of lines that are no longer included in the working lines definition were excluded from the distribution, while the lengths of new categories of lines were included. The changes to working lines also led to changes in the allocation of costs between MDFs (i.e. for cost categories which were allocated on the basis of the number of working lines).

TERA is of the view that it was appropriate to update the working lines definition to reflect the actual costs and revenues included in the USO model as outlined in Decisions 2, 3 and 6 of D04/11.

²² Stand-Alone Broadband (This provides a standalone DSL broadband service over the local loop, without a 'PSTN' service).

4.3.4. Inclusion of broadband data

A part of revenues from broadband data usage were not included in the revenues distribution in the initial 2014/15 USO funding application. It has been corrected in the final 2014/15 USO funding application.

TERA is of the view that it is necessary to include all the relevant broadband revenues. This change is in line with Decision 4 of D04/11.

4.3.5. Allocation of specific supplementary revenues to lines

Eir has identified that in its initial 2014/15 USO funding application several revenue categories were allocated to all lines where PSTN/ISDN rental charge was present rather than only to the lines effectively generating this revenue. It has been corrected in eir's final 2014/15 USO funding application: these revenues were re-allocated only to relevant lines.

TERA is of the view that it is most appropriate to allocate the revenues only to lines to which they correspond to be in line with Decision 4 of D04/11.

4.3.6. Identification of NGA revenues separately

Certain costs related to the Next Generation Access (NGA) network were separately identified in eir's regulatory accounts. Hence, additional cost categories (and associated revenues) were considered in eir's final 2014/15 USO funding application, however the costs covered by these asset classes were captured by other asset classes in previous years, so their inclusion does not represent an increase in the scope of costs included in the USO model.

TERA is of the view that it was appropriate to update the cost categories to:

- (1) reflect the change in the categorisation of cost/revenues associated to the NGA network; and**
- (2) then reflect the actual costs and revenues included in the USO model as outlined in Decisions 2, 3 and 6 of D04/11.**

4.4. Conclusion

TERA concludes that the approach to the treatment of the revenue data in eir's final 2014/15 USO funding application is reasonable and that it is consistent with Decisions 2 to 7 of ComReg Decision D04/11. A summary of eir's rationale for revenue exclusions, further changes in line definition and TERA's assessment is also set out in Table 4 below.

Table 4 – Summary - Revenue Data Changes

Change	eir's rationale for the change	TERA's assessment
Revenue data exclusions	Non USO services Large MDF based Services (this includes Freefone (national and international) and Interconnect links) Non MDF specific services Competitive services	May be excluded for the purpose of USO direct net cost calculation.
Allocation of one-off revenues	One-off revenue categories are allocated to the year in which they were incurred ²³ except PSTN connections which are recognised in the same period as the initial connection, without amortization. The PSTN connections are offset by the corresponding costs, which are treated in a similar manner. All the connection revenues (excluding RAT and PSTN) are already amortised within the regulatory accounts, over expected customer lifetime ²⁴ . Thus regulatory amortisation is already incorporated within the model input data. RAT connections are amortised in the Area model.	The PSTN connection cost was not included in the amortisation. As eir's treatment for costs is similar to the treatment of revenues, this approach is acceptable.
Changes in working line definitions	Inclusion of new services in line count (as SABB).	TERA agrees with this change as it ensures that eir is taking into account "all" capital costs and "all" operating costs as per the Decision 2 of D04/11
Inclusion of broadband data	Correction after omission in eir's initial application.	TERA agrees it is necessary to include revenues associated with broadband data.
Allocation of specific supplementary revenues to lines	Correction of the allocation of several revenue categories that were allocated to all lines where PSTN/ISDN rental charge was present rather than only to the lines effectively generating this revenue.	TERA is of the view that it is most appropriate to allocate the revenues only to lines to which they correspond.
Identification of NGA revenues separately	'Re-categorisation' of NGA associated costs separately to	TERA agrees with this change as it ensures that eir is taking into account "all" capital costs and "all"

5. Cost Data

5.1. Section Overview

Decisions 1, 2, 8 and 9 of D04/11 apply to the cost data used by eir in its calculation of avoidable costs. Cost data includes OPEX and CAPEX of access networks and of core networks. In summary:

- Decision 1 states that the HCA methodology, with certain adjustments, is the cost methodology that must be used to calculate the net cost.
- Decision 2 sets out the basis for calculating avoidable costs relevant to the calculation of the direct net cost.
- Decision 8 and Decision 9 set out the basis for determining avoidable costs for inclusion in the net cost calculation, and the methodologies to determine the appropriate level of costs that would have been incurred by an efficient operator.

The full text of these decisions is as follows:

Decision 1: *The HCA methodology, properly adjusted for efficiencies and taking account of the costs that could have been avoided by the USP without having the USO, is the cost methodology that must be used to calculate the net cost of the USO.*

Decision 2: *USO net costs shall be calculated on the basis of “all” capital costs and “all” operating costs that could be avoided on a HCA basis, as if the provision of services to uneconomic customers by a commercial operator was not required under a USO. It is only the portion of costs, both capital and operational expenditure for the given financial year, that can be directly attributed to the USO service (i.e. the service activity creates the cost) and which could have been avoided without the USO, which are included in the net cost calculation.*

Decision 8: *The avoidable costs included in the net cost calculation, shall be those costs reflecting the provision of the USO which a commercial operator would not ordinarily have provided, and which were incurred in the most efficient way. These costs shall relate to: (a) the avoidable capital costs associated with CAPEX i.e. depreciation; (b) OPEX; and (c) overheads for the appropriate financial year.*

Decision 9: ComReg may use a number of methodologies to determine the appropriate level of costs that would have been incurred by an efficient operator, in order to determine the quantum of adjustments necessary to the USP's net cost calculation. These methodologies may include, but are not limited to, the use of:

- The review of supporting documentation available, such as: cost-benefit analysis reports; engineering reports; fault reports of geographical areas, and other documents in relation to the business case / investment decisions associated with the network roll-out and upgrade;
- A line fault efficiency rate: applying the national LFI target rate (corresponding to the financial year in question) at a regional level (and allowing for appropriately reasoned variances) ;
- Independent survey report regarding the USP's efficiency;
- Regulatory decisions from other jurisdictions that provide relevant precedents and benchmarks; and
- The development of a model to assess the appropriateness of the efficiency adjustment proposed by the USP.

This section reviews eir's final 2014/15 USO funding application cost data for adherence with Decision 1, 2, 8 and 9 of D04/11 under the following headings:

- Cost methodology
 - Included Cost Categories
 - Cost avoidability
 - Access network OPEX; and
 - Avoidable Costs Analysis.
 - OPEX efficiency
 - Cost Allocation
 - Efficiency adjustments
 - "Distance-sensitive" categorisation
 - Cost curves for Core Network
- Conclusion

TERA assessed the treatment of costs in terms of which categories of costs are relevant to the different decisions stated above, how they are allocated between MDFs and lines, which costs are avoidable, and which costs are distance sensitive.

5.2. Cost Methodology

As required by Decision 1 of D04/11, the cost data is taken from eir's historical cost accounts (HCA) and is adjusted for efficiencies and to take account of avoidable costs, calculated in accordance with Decision 2 and Decision 8.

When analysing costs, TERA paid particular attention to the following main issues:

- Which cost categories are included in the USO model and whether they correspond to revenue services
- Which cost categories are defined as avoidable or partially avoidable

- How costs are allocated to MDFs
- How efficiency adjustments are made.

5.2.1. Included Costs Categories

In accordance with Decision 8, the cost data includes OPEX and CAPEX of access networks and of core networks.

TERA first considered the costs categories identified by eir to ensure they were treated correctly. TERA noted that eir included in the final 2014/15 USO funding application the following additional costs (which were also included in its final 2010/11 to 2013/14 USO funding applications but were not included in eir's 2009/10 USO funding application):

- BIP and Ethernet SANS (over copper) revenues and OPEX.
- CAPEX associated with the building pool
- The cost of PRA/FRA CPE for ISDN lines

TERA considers that the above costs are correctly included in the USO Model. The accuracy of the input data amounts for BIP, Ethernet SANS and OPEX and the building pool CAPEX within eir's final 2014/15 USO funding application have been verified by PWC via the AUP process (by comparing the values on the input sheets back to the source workbooks).

As a result of changes made by eir to the FAR categorisations, a new NGA Network Element was created in 2014/15, This new categorisation was not included in the previous USO models. This NGA network element now separately captures costs that were included within other Network Elements in previous years. Accordingly the inclusion of this new NGA Network Element does not represent an increase in the scope of costs included in the model.

TERA is of the view that the above costs are appropriate for inclusion in the USO Model.

5.2.2. Cost Avoidability

Having considered the cost data, TERA then reviewed the USO Model to assess the proportion of these costs which could be avoided if certain MDF areas were no longer served by eir.

5.2.2.1. Access Network OPEX

If an activity code is 'Indirect'²⁵, the avoidability percentage is estimated by considering the avoidability of the SRT codes that underlie that activity code.

eir made some minor changes to the categorization of SRT codes (see Table 5) in the initial 2014/15 USO funding application as against its 2009/10 USO funding application.

Table 5 - Minor Changes in SRT code categorisation 2014/15

(Based on a sample list of SRT codes provided)

Activity Code	Description	Total OPEX (Essbase)	Category	% avoidable 2014/15	% avoidable 2009/10	Shortfall in avoidable opex
GB113	Network Mgmt. Systems	✂	Indirect	✂	✂	✂
GB140	DC Power	✂	Indirect	✂	✂	✂
GB149	Switching network – edge	✂	Indirect	✂	✂	✂
GF113	Network Mgmt. Systems	✂	Indirect	✂	✂	✂
GF122	Network Rates	✂	Indirect	✂	✂	✂
GF140	DC Power	✂	Indirect	✂	✂	✂
GF149	Switching network – edge	✂	Indirect	✂	✂	✂
Total						✂

Source, Frontier Report USO Model documentation 2014/15 and 2009/10 TERA Analysis

TERA does not have full information on each individual SRT code however TERA used sampling to check the SRT code categorisation (see section 5.2.2.2 of this report) reviewed as part of the AUP.

Based on this sampling, TERA estimates that the impact of these changes made by eir to SRT code categorisation is minor, and these changes are acceptable.

5.2.2.2. Avoidable Costs Analysis

The USO Model²⁶ submitted as part of eir's final 2014/15 USO funding application, details the costs that are avoidable at the MDF level.

TERA has used the access network OPEX cost models (based on the 2016 CAM) to provide a comparable cross check, by identifying those cost categories that vary in accordance with the number of faults.

²⁵ Activity codes classified as 'Indirect' are those capturing costs that are not directly related to operations in a given MDF area, but which may change in response to changes in the level of direct costs.

²⁶ As described by section 3.1.2 of the Frontier Report.

This cross-check shows that while certain cost avoidability assumptions are not the same as the 2016 CAM (which is the most recent assessment of eir's cost avoidability assumptions), the differences, in TERA's view, are non-material and are therefore acceptable.

Table 6 below shows the consistency between the avoidability calculation in the 2014/15 USO Model and the implementation rules of the 2016 CAM (colour coded "green" within the OPEX Model column of Table 6).

Some cost categories (see Table 6 - colour coded "violet" within the OPEX Model), are considered unavoidable in the USO Model, while they are partially or fully avoidable in the 2016 CAM. This "unavoidable" assumption is conservative (as most of the time the assumption considers that no cost would be avoided absent USO, and therefore tends to under-estimate the net cost). TERA therefore considers that this approach cannot lead to eir over-estimating the net cost. eir has also provided further explanations for the classification of other cost categories, based upon which TERA concluded that those cost classifications are acceptable (see Table 6 - colour coded grey within the OPEX Model column).

In addition, eir made some minor changes to the categorization of SRT codes in eir's initial 2014/15 USO funding application compared to eir's 2009/10 USO funding application. eir intended to use this revised categorization for 2014/15 however it used the 2009/10 categorization instead by error in the initial 2014/15 USO funding application. This error has been corrected in eir's final 2014/15 USO funding application.

For the reasons stated in this section and Table 5 and Table 6, TERA considers the cost avoidability assumptions applied by eir to be reasonable.

Table 6. Example: Subscriber Unit' network element - Avoidability Analysis & 2016 CAM cross-check

Colour Coding Legend for OPEX Model Column:

	Corresponds with the 2016 CAM
	Does not correspond with the 2016 CAM, but shows a conservative assumption
	Acceptable based on additional information provided by eir

Activity Code	Description	Total OPEX (Essbase)	Category	% avoidable	Avoidable OPEX	OPEX Model
GB113	Network Mgmt. Systems	✂	Indirect	✂	✂	<u>Additional information provided by eir:</u> Design for operations in the various network management centres. 5.2.3. Cost Allocation

5.2.3.1. Cost Drivers – Access OPEX Allocation Across MDFs

In the Frontier Report (section 3.1.3), eir details the cost drivers used to allocate avoidable OPEX to MDFs.

TERA has reviewed the above cost drivers and compared them, as a cross-check, with the cost drivers in the 2016 CAM (see Table 7 - OPEX Model column). Some cost drivers are the same as in the 2016 CAM (see Table 7 - highlighted in “green” within the OPEX Model column). Some cost drivers are not exactly the same, however TERA considers that the approach is reasonable and can be explained by the differences in the available data (see Table 7 - highlighted in “grey” within the OPEX Model column).

In eir’s initial 2014/15 USO funding application the “Repair – access” cost category was allocated exclusively based on the number of faults. However, TERA notes that repair activities are performed by “service assurance teams” which are organised by service assurance areas.

As a consequence, TERA informed ComReg that it considered that these costs should be first allocated to the service assurance areas based on the number of staff. Repair activities should then be allocated to the MDFs within the area based on the number of lines of number of faults. TERA’s view is that such an approach is more in line with the cost causality principle as it reflects that faults may be more expensive to address in some areas (e.g. due to longer transport times for maintenance team). This also reflects that repair team sizes are assembled based on these factors and, furthermore, this approach is more in line with the 2016 CAM cross-check.

TERA made a number of recommendations to ComReg in relation to eir’s “Repair – access” cost category during the assessment period of eir’s initial 2014/15 USO funding application. This led to eir changing its approach to the “Repair – access” cost category in line with TERA’s recommendation in its final 2014/15 USO funding application.

TERA considers that eir’s cost driver assumptions in the final 2013/14 USO funding application are reasonable.

Table 7. Cost allocation drivers - Avoidable OPEX to MDFs

Colour Coding Legend for OPEX Model Column:

	Same as OPEX model of the 2016 CAM or zero cost
	Different from OPEX model of the 2016 CAM but differences are reasonable and non-material

Network Element	Cost Driver	CAM - OPEX Model
Copper Access Network	Varies depending on appropriation code (see below) Includes expenditure on preventative and restorative maintenance, number of working lines, and number of faults	-
Provisioning – Access	Physical Provides (ULMP ²⁷ , PSTN/ISDN, DSL-R ²⁸ , DSL-B ²⁹ , SB-WLR ³⁰)	Allocation to the service assurance teams number of staff and then to the MDF within the service area based on the active lines

²⁷ Unbundled Local Metallic Path

²⁸ Digital Subscriber Line-Retail

²⁹ Digital Subscriber Line-Bitstream

³⁰ Stand-Alone Broadband Wholesale Line Rental

Provisioning – Retail	Physical Provides (DSL-R, DSL-B, SB-WLR)	Allocation to the service assurance teams number of staff and then to the MDF within the service area based on the active lines
Provisioning – Leased Lines	Number of working lines (leased lines)	Allocation to the service assurance teams number of staff and then to the MDF within the service area based on the active lines
Repair – Leased Lines	Number of working lines (leased lines)	Allocation to the service assurance teams number of staff and then to the MDF within the service area based on the active lines
Repair – Access	Number of faults -> changed to Number of repair staff combined with number of faults (MSO, MSN, MCY, Total faults)	Allocation to the service assurance teams number of staff and then to the MDF within the service area based on the active lines
Legacy leased line equipment (Dassnet)	Gross Book Value relating to leased lines (asset classes 2814, 2818, and 2821)	Zero
DSLAMs	Number of working lines (DSL)	Zero
Building Pool	Number of working lines (All copper lines; DSL lines) Gross Book Value relating to leased lines (asset classes 2814, 2818, and 2821)	Allocated based on number of telephony pairs
Retail DSL	Number of physical provides (DSL)	Zero
Retail PSTN / ISDN	Number of physical provides (PSTN/ISDN)	Zero
BIP	Number of working lines (Supplementary services)	Zero

5.2.4. Efficiency adjustments

Decision 9 of D04/11 (set out above) refers to the possibility of using a number of methodologies to determine “*the appropriate level of costs that would have been incurred by an efficient operator...*” and lists five types of methodologies that may be used to determine the quantum of adjustments necessary.

eir has made a number of efficiency adjustments in line with Decision 9. First, eir made efficiency adjustments based on the second of the methodologies in Decision 9, “*line fault efficiency rate*”. eir’s efficiency adjustment to the LFI led to a downward adjustment to the direct net cost as eir’s average national LFI is higher than that set by ComReg.

Second, eir incorporated other efficiency adjustments into its 2014/15 USO Models based on the fifth Decision 9 methodology, in respect of the following maintenance activities:

- MLC: Reactive maintenance costs associated with customer carriers.
- MLO: Reactive maintenance costs associated with copper overhead network.
- MLU: Reactive maintenance costs associated with copper underground network.

Furthermore, two steps of efficiency adjustment of the LFI rate have been used in the USO model:

- An efficiency adjustment at the national level if the actual national fault of eir is higher than the PIP target rate set by ComReg.
- As eir’s actual fault rate (13.6%) is lower than the PIP target rate set by ComReg (14.5%), no efficiency adjustment has been made at the national level.
- As the same level of efficiency may not be achieved for all areas of Ireland, a 2nd efficiency adjustment is envisaged. For each MDF, eir’s number of faults is compared to the results of a modelling of a target number of faults based on the characteristics of the area (percentage of carriers, percentage of cables on poles, number of working lines, percentage of DSL lines, working line density (working lines per sq. km)). The number of faults for MDFs significantly above the target are adjusted (the actual number of faults is considered as an outlier if it is higher than the one predicted by the regression plus the standard deviation).

While there are no methodological changes in this area of the application compared to the final 2013/14 USO funding application, TERA notes that two methodological changes have been made to the fault rate regression analysis compared to the approach taken in eir’s 2009/10 USO funding application:

- Wholesale lines are out of the scope of the target fault rate, and therefore have been excluded from the regression. As the ‘Efficient target’ fault rate is now defined based on faults on eir’s retail lines only, the number of working lines was changed from “all

lines” (excluding fibre) to only “PSTN and Retail SABB lines”. The percentage of DSL lines (calculated by taking the number of DSL lines and dividing this by the number of working lines), was updated accordingly. Similarly the line density, calculated as the number of working lines per square kilometre, was updated.

- The analysis has been performed on the number of faults rather than on the LFI. According to eir, this led to more accurate regression results and, in particular, allowed negative results to be avoided.

TERA agrees with the approach to adjust operating expenditure related to line faults and considers the two changes in methodology (change in working lines definition and the approach based on the “number of actual faults that occurred”) to be reasonable as this may lead to a more accurate calculation of predicted fault rates.

5.2.5. “Distance-sensitive” categorisation

Distance sensitive costs are those that vary depending on the length of a line. Data from the 2009 CAM³¹ (is used to allocate these costs to housing and isolated areas. eir’s Frontier Report (section 3.1.4) maps the network service elements to 3 categories:

- Distance-sensitive
- Non distance-sensitive
- Provisioning

This classification is an input to the calculation of avoidable costs at the customer level.

TERA has reviewed this mapping and concluded, based on available classification information, that this is a reasonable approach for each cost element.

The details of this cost allocation or mapping are provided in Table 8 (Details from the OPEX Model and Analysis column).

Based on the further details and explanations provided by eir (as stated in table 8 below), TERA has sufficient information to determine that eir’s approach to “distance- sensitive” cost categorisation is reasonable.

³¹ For year 2013 - the last year implemented in the 2009 CAM model. ComReg had accepted that eir “prepare avoidable cost shares by taking an single year (e.g. FY 2013/14) as a reference” where the 2009 CAM was being used.

Table 8. Mapping of distance sensitive, and non-distance sensitive Network Service Elements to services and provisioning

Legend:

Acceptable to TERA				
Network Element	Specific Network Element (or appropriation code for Copper Access Network)	Associated service	Provisioning, Distance sensitive or Non-distance sensitive	TERA's Assessment
Copper Access Network	MLC	Based on split in regulatory accounts	Distance sensitive	MLC - Customer Carriers → OK as the number of faults increases with the distance
Copper Access Network	MLG	Based on split in regulatory accounts	Distance sensitive	MLG - Lightning Damage → OK as the number of faults increases with the distance
Copper Access Network	MLI	Based on split in regulatory accounts	Distance sensitive	MLI – Pressurisation → OK as the number of faults increases with the distance
Copper Access Network	MLO	Based on split in regulatory accounts	Distance sensitive	MLO - Overhead Network → OK as the number of faults increases with the distance
Copper Access Network	MLR	Based on split in regulatory accounts	Non-distance sensitive	MLR - Mtce Local Radio → OK as local radio costs are not distance-driven

Copper Access Network	MLU	Based on split in regulatory accounts	Distance sensitive	MLU - Underground Network → OK as the number of faults increases with the distance
Copper Access Network	MRO	Based on split in regulatory accounts	Distance sensitive	MRO - Unbillable damage – overhead → OK as the number of faults increases with the distance
Copper Access Network	MRU	Based on split in regulatory accounts	Distance sensitive	MRU - Unbillable damage – underground → OK as the number of faults increases with the distance
Copper Access Network	MVO	Based on split in regulatory accounts	Distance sensitive	MVO - Overhead Network → OK as the number of faults increases with the distance
Copper Access Network	MVU	Based on split in regulatory accounts	Distance sensitive	MVU - Underground Network → OK as the number of faults increases with the distance
Copper Access Network	MTT	Based on split in regulatory accounts	Non-distance sensitive	MTT – Records As explained by Eir, they consider it is more appropriate to treat MTT costs as non-distance sensitive given that the information recorded in ANMR primarily involves the recording of cable characteristics at discrete (non distance) originating or termination nodal points (MDF, Drop point, Cabinets) and the location of these points. → OK

Copper Access Network	MXY	Based on split in regulatory accounts	Non-distance sensitive	MXY - DC Power Maintenance → OK as related to Eir sites
Copper Access Network	GF122	Based on split in regulatory accounts	Non-distance sensitive	GF122 - Network Rates As explained by Eir, GF122 relates to the network rates that are paid by Eir to local authorities. → OK
Copper Access Network	GB101	Based on split in regulatory accounts	Non-distance sensitive	GB101 - Access Nwk. Overhead As explained by Eir, it relates to primarily non-field staff costs for Network planning and Design of the Access Network. These are both treated as non-distance sensitive since they are central costs that do not vary with the size of the network in terms of line length. →OK
Copper Access Network	GB102	Based on split in regulatory accounts	Non-distance sensitive	GB102 - Access Nwk. Underground As explained by Eir, it relates to primarily non-field staff costs for Network planning and Design of the Access Network. These are both treated as non-distance sensitive since they are central costs that do not vary with the size of the network in terms of line length.
Dassnet	Dassnet Equipment	Supplementary Services	Non-distance sensitive	Data network → equipment with a cost that is not distance-sensitive
Retail - DSL	Retail - DSL	DSL-Retail	Non-distance sensitive	Retail cost → not distance-sensitive

Retail - PSTN/ISDN	Retail - PSTN/ISDN	PSTN/ISDN	Non-distance sensitive	Retail cost → not distance-sensitive
DSL-DSLAM	DSL-DSLAM	DSL-Retail/DSL-Bitstream	Non-distance sensitive	Retail cost → not distance-sensitive
Leased Line - Provisioning	Leased Line - Provisioning	Leased Line	Provisioning	Provisioning activity
Leased Line - Repair	Leased Line - Repair	Leased Line	Non-distance sensitive	As explained by Eir, the costs of “leased lines repair” relates to the repair of customer equipment not length of line. → OK
Repair - Access	Repair - LLU (CMA)-4	UMLP	Distance sensitive	→ OK as the number of faults increases with the distance
Repair - Access	Repair - LLU (Approp)-4	UMLP	Distance sensitive	→ OK as the number of faults increases with the distance
Repair - Access	Repair - LLU (Other)-4	UMLP	Distance sensitive	→ OK as the number of faults increases with the distance
Repair - Access	Repair - Wholesale Other (Other)-4	DSL-Bitstream	Distance sensitive	→ OK as the number of faults increases with the distance
Repair - Access	Repair - PSTN - (Approp)-4	PSTN/ISDN	Distance sensitive	→ OK as the number of faults increases with the distance
Repair - Access	Repair - PSTN Dispatch & Clear (CMA)-4	PSTN/ISDN	Distance sensitive	→ OK as the number of faults increases with the distance

Repair - Access	Repair - ISDN Dispatch & Clear (CMA)-4	PSTN/ISDN	Distance sensitive	→ OK as the number of faults increases with the distance
Subscriber Unit	Subscriber Unit	PSTN/ISDN	Non-distance sensitive	→ Ok as "SU" costs are not distance sensitive
Provisioning - Access	Provisioning - LLU (CMA) Other-4	UMLP	Provisioning	Provisioning activity
Provisioning - Access	CB125-4	UMLP	Provisioning	CB125 - LLU (Co Location) → Provisioning activity
Provisioning - Access	Provisioning - LLU (Approp)-4	UMLP	Provisioning	Provisioning activity
Provisioning - Access	Provisioning - PSTN Access-4	PSTN/ISDN	Provisioning	Provisioning activity
Provisioning - Access	IPC-4	PSTN/ISDN	Provisioning	IPC - Provisioning Control → Provisioning activity
Provisioning - Access	CD101-4	PSTN/WLR	Provisioning	Provisioning activity
Provisioning - Access	Provisioning - ISDN Access-4	PSTN/ISDN	Provisioning	Provisioning activity
Provisioning - Access	Provisioning - DSL-4	DSL-Retail	Provisioning	Provisioning activity

Provisioning - Access	Provisioning - Access Bitstream-4	DSL-Bitstream	Provisioning	Provisioning activity
Provisioning - Retail	Provisioning - CPS WLR-4	WLR	Provisioning	Provisioning activity
Provisioning - Retail	Apparatus Supply	Supplementary Services	Provisioning	Provisioning activity
Provisioning - Retail	DSL (Retail)	DSL-Retail	Provisioning	Provisioning activity
Provisioning - Retail	PSTN CPE Equipment Rental (GL 10658 split) - WLR CPE	PSTN/WLR	Provisioning	Provisioning activity
Data Services	Data - BIP-4	Supplementary Services	Non-distance sensitive	As explained by Eir, this is equipment (routers) that support BIP services. The cost is not dependent on length but on capacity, software, configuration required, etc. Therefore, they are treated as non-distance sensitive. →OK
Data Services	Data - Ethernet-4	Supplementary Services	Non-distance sensitive	This is equipment (routers) that support BIP services. The cost is not dependent on length but on capacity, software, configuration required, etc. Therefore, they are treated as non-distance sensitive. →OK
Building Pool	PSTN	PSTN/ISDN	Non-distance sensitive	Related to buildings → non distance sensitive

Building Pool	DSL/BS	DSL-Retail/DSL- Bitstream	Non-distance sensitive	Related to buildings → non distance sensitive
Building Pool	LL	Leased Line	Non-distance sensitive	Related to buildings → non distance sensitive
Building Pool	SUP	Supplementary Services	Non-distance sensitive	Related to buildings → non distance sensitive

Source: Frontier Report, USO Model Documentation 2014/15, Table 15 p50

5.2.6. Cost Curves for Core Network

CVR is the curve that describes how the cost of the core network changes in relation to call volumes. The CVRs used in the USO Model have been extracted in the main from the latest TD-LRIC model that has been previously used to set regulated interconnection rates and also from BT UK Group model³².

TERA analysed the examples of CVRs used in the USO Model in eir's initial 2014/15 USO funding application. TERA raised certain queries, which led to ComReg requesting clarifications from eir on the use of CVR's. eir's additional clarifications and TERA's assessment of these is set out below:

- SEC-SWITCH-E10-1312,1314,1316, TERTIARY-SWITCH-1312, 1314, 1316. eir confirmed that it is now assumed that the cost increases linearly between 76% and 100%.
- TERA notes that this CVR is therefore very close to the one used by BT.

According to the BT model³³, in order to deliver 0% of traffic volume, it is necessary to invest 40% of costs (fixed costs), and in order to deliver 1% of traffic volume, it is necessary to invest 76% of costs. Between 76% and 100% the cost increases rather linearly with the traffic Billing-CDCS-CMA.

- TERA considers that the assumption used in eir's 2014/15 USO Model is correct. Based on this assumption, the cost is equal to zero in 2014/15 and therefore no CVR is needed.
- TERA notes that the CVRs used in eir's final 2014/15 USO funding application USO Models are the same as those used in the final 2009/10 USO funding application, which TERA considered reasonable.

Based on the above clarifications, TERA considers it reasonable for eir's final 2014/15 USO funding application to continue to use CVRs based on the TD-LRIC model and on the BT UK Group model.

5.3. Conclusion

TERA has reviewed the additional cost data information provided by eir and concludes that it is consistent with Decisions 1, 2, 8 and 9 of D04/11 as:

- HCA costs are adjusted for efficiency (Decision 1)**
- Relevant CAPEX and OPEX are included (Decision 8)**
- Only relevant avoidable costs are included (Decisions 1 and 2)**
- Costs correspond to the services that a commercial operator would not provide (Decision 2)**
- Required efficiency adjustments have been made (Decision 9)**

6. Area model

6.1. Section Overview

This section reviews eir's final 2014/15 USO funding application against the principles and methodologies set out in Decisions 11 and 12 of D04/11, the full text of which is set out below.

Decision 11: Uneconomic areas shall be identified at an MDF level.

Decision 12: An average depreciation charge for each class of network element (based on an average cost and asset age) shall be developed by geo-types (e.g. urban, sub-urban, rural etc.). The USP may allocate the relevant depreciation charge (as reconcilable to the HCA accounts and taking account of the principle of avoidable costs) for each exchange area based on the asset requirements as determined by the Copper Access Model (as updated or similar modelling tool). The calculation must be sufficiently granular to allocate costs only to those network elements actually used by users who are potentially uneconomic. In making this allocation, the USP should draw on, and be prepared to substantiate its investment profile / decision making, works-orders etc., so as to ensure that the allocation is appropriate (i.e. the USP should satisfy itself that in making an allocation to an MDF area, it has not allocated costs which are not reflective of the USP's investment profile in that MDF area).

The Area Model calculates the direct net cost of uneconomic areas (i.e. where an area corresponds to one MDF, based on the network structure) and where the avoidable costs are greater than the total revenues foregone. This is consistent with the principle of avoidable costs: where the ability to avoid costs is largely determined by the capability to remove parts of the network that the USP, as a commercial operator, would not have chosen to serve in the absence of the USO.

TERA's assessment is that the calculated direct net cost of uneconomic areas in the Area Model is €0.31M. This figure reflects the amount eir claimed in its final 2014/15 USO funding application. This figure constitutes about 2% of the total direct net cost.

This reduction in direct net cost is caused by methodology changes outlined in previous sections:

- Changes to the avoidability of operating costs at the area level (section 5.2.2).
- Efficiency adjustments for line fault costs (section 5.2.4).
- Allocation of costs to MDFs (section 5.2.3)

6.2. Area Model Assessment

Chapters 4 and 5 have identified a number of adjustments to the treatment of the revenue and cost input data. For example:

- bigger sample size used in the allocation of revenues to MDFs to give more precision;
- inclusion of OPEX for BIP and Ethernet SANS³⁴ (over copper) which may potentially lead to some increase in the direct net cost of uneconomic areas;
- Inclusion of building pool CAPEX which may potentially lead to some increase in the direct net cost of uneconomic areas.

6.2.1. Methodology

Uneconomic areas are defined at the MDF level by comparing costs with revenue. The cost of these areas is determined as follows:

1. Estimate costs and revenue for each MDF and determine the preliminary list of uneconomic MDFs.
2. Deduct double counted revenue generated by traffic between two uneconomic areas. Reduce traffic towards economic areas from uneconomic areas, repeat until result is stable.
3. Distribute leased line revenues: if they connect economic and uneconomic areas, revenue should be attributed to the uneconomic one.
4. Add replacement revenues (coming from calls made by disconnected subscribers using connections in other areas or of other subscribers).

The difference between eir's initial 2014/15 USO funding application and eir's final 2014/15 USO funding application is a result of:

- the minor changes in the data treatment as described in previous sections; and
- the correction of an inconsistency in the calculation³⁵ (e.g. one correction has a small impact on the Area Model; reducing the direct net cost by €1600³⁶).

TERA has not identified any methodological changes in the Area Model for 2014/15 as compared to the 2009/10 USO Model. In summary, the changes in the Area Model direct net cost from 2009/10 to 2014/15 appear to be as a result of the evolution or changes in input data, specifically, revenue data and cost data.

6.2.2. TERA's Assessment of the direct net cost claimed

TERA's assessment is that the calculated direct net cost of uneconomic areas is €0.31M. This constitutes about 2% of the total direct net cost.

³⁴ Storage Area Network

³⁵ A calculation error has been identified that has only a small impact.

³⁶ Frontier Supplemental Report, Page 23.

The number of uneconomic MDFs in 2014/15 is 1,064 (out of a total of 1,064 MDFs). Table 9 outlines the direct net cost for each uneconomic MDF in 2014/15. 1,064 MDF areas became uneconomic when compared to the data in eir's final 2013/14 USO funding application³⁷.

Table 9 below summarizes the main evolution between 2013/14 and 2014/15 in terms of direct net cost per uneconomic MDF to assess the impact of the treatment of input data (reviewed in previous section) on the Area Model figures

Table 9. Direct net cost assessment for Uneconomic MDFs – difference between assessment in 2013/14 and assessment in 2014/15 for uneconomic MDFs (€)

1,064

Source: 2013/14 and 2014/15 USO Models, TERA analysis

The USO direct net cost increased in 1,064 of the uneconomic MDFs and 1,064 new MDF's became uneconomic (compared to eir's final 2013/14 USO funding application (Table 9).

Table 10 shows that the main reason for the direct net cost increase in these MDFs is a general downturn in revenues and a significant rise in access costs for some specific MDFs (1,064).

Table 10. Change in costs and revenues between assessment in 2013/14 and assessment in 2014/15 for selected MDFs (€)

1,064

Source: 2013/14 and 2014/15 USO Models, TERA analysis

The variations in the direct net cost of uneconomic areas are mainly explained by the investments made by eir in particular MDFs, and by a higher level of NBV, cost of capital and depreciation.

TERA has also studied changes in core costs. Table 11 demonstrates that unit costs have increased in 2014/15 when compared to 2013/14 on a per minute basis when they tend to decrease on a per call and per minute basis.

³⁷ Of the 1,064 uneconomic areas in 2013/14 (out of 1,064), only 1,064 are still uneconomic in 2014/15.

Table 11. Change in the unit core costs between 2013/14 and 2014/15

Source: 2013/14 and 2014/15 USO Models, TERA analysis

The core unit costs are calculated from the historic costs of the network elements used in the conveyance of calls across the PSTN network, by applying avoidability rates based on CVRs, using a routing matrix which defines usage of network elements, by each service, and volumes of call services. Changes in any of these components can imply a change in the unit core costs.

Accordingly, the changes in the direct net cost of studied MDFs come mainly from changes to the input data, as a result of changes in consumption, routing factors and regulatory accounts, and not from changes in the Area Model itself. TERA has identified no changes in the Area Model itself and confirms that the calculations are performed correctly.

6.3. Conclusion

TERA has reviewed the Area Model and concludes that the calculations are performed correctly and are consistent with the methodological approach set out in D04/11, in particular Decisions 11 and 12.

There were no methodological changes in 2014/15 when compared to eir's final 2013/14 USO funding application and the only changes in direct net cost calculation as compared to eir's 2009/10 USO funding application relate to the treatment of input data, which are external to the model and due to changes in:

- structure of regulatory accounts**
- routing factors**
- mapping of services**

7. Customer Model

7.1. Section Overview

This section reviews the Customer Model element of eir's 2014/15 USO funding application to check that it is in accordance with Decisions 10, 12, 13, 14 and 25 of D04/11.

TERA's assessment is that the calculated direct net cost of uneconomic customers in the Customer Model is €10.39M. This constitutes 85% of the total direct net cost claimed by eir.

The full text of the relevant decisions is set out below:

Decision 10: *The net cost calculation shall not include those customers who were originally considered "uneconomic" but who have now become profitable. The net cost calculation also does not include those customers attained as a direct result of a competitive tendering process (who are deemed "uneconomic").*

Decision 12: *An average depreciation charge for each class of network element (based on an average cost and asset age) shall be developed by geo-types (e.g. urban, sub-urban, rural etc.).*

The USP may allocate the relevant depreciation charge (as reconcilable to the HCA accounts and taking account of the principle of avoidable costs) for each exchange area based on the asset requirements as determined by the Copper Access Model (as updated or similar modelling tool).

The calculation must be sufficiently granular to allocate costs only to those network elements actually used by users who are potentially uneconomic. In making this allocation, the USP should draw on, and be prepared to substantiate its investment profile / decision making, works-orders etc., so as to ensure that the allocation is appropriate (i.e. the USP should satisfy itself that in making an allocation to an MDF area, it has not allocated costs which are not reflective of the USP's investment profile in that MDF area).

Decision 13: *Uneconomic customers in economic areas shall be identified based on universal account numbers ("UANs"). However, if ComReg is satisfied, because of a lack of information beyond the control of the USP, that it is not practicable to identify uneconomic customers by UAN, the USP must demonstrate that the use of an alternative approach has the equivalent effect of identifying those customers.*

Decision 14: *The USP may calculate uneconomic customers in economic areas using a probability analysis. However, the identification and allocation of these costs must be consistent with ComReg's decision outlined in Decision No. 12.*

The parameters and assumptions used in the probability analysis must be clearly documented and duly reasoned as to the circumstances why the USP considers the customer uneconomic.

Decision 25: Applications shall, with reference to the supporting model clearly identify (by MDF or by geographic location as appropriate), with adequate reasoning and cogent evidence to justify that, those customers or groups of customers (i.e. area), that in the absence of the USO, the provision of the service would either not continue to be provided or would never have been provided, to that customer or groups of customers (i.e. area) by a commercial operator, or by the USP acting as a commercial operator. The USP must provide its commercial reasoning, including the respective parameters used in justifying its decision, including, but not limited to:

- The current loss-making status of those customers or areas;
- The local density of those customers or areas;
- The respective distances from exchange for uneconomic customers;
- The network infrastructure / technology used to serve those customers or areas; and
- Any other pertinent information the USP has used to influence its decision making process.

Furthermore, applications must not include those customers attained through a competitive tendering process, or those customers which have now become economic, but who were previously considered uneconomic.

7.2. Customer Model Assessment

As stated above, Decision 13 of D04/11 requires the calculation of the direct net cost for each individual uneconomic customer in economic areas “to be identified based on universal account numbers (“UANs”)”.

However, Decision 13 also states that where, due to “a lack of information beyond the control of the USP”, it is “not practicable to identify uneconomic customers by UAN, the USP must demonstrate that the use of an alternative approach has the equivalent effect of identifying those customers.” In other words, an objectively justified alternative approach to this calculation is acceptable, such as a “probabilistic approach” (as outlined in Decision 14 of D04/11).

7.2.1. Methodology

In eir’s final 2014/15 USO funding application, a probabilistic approach rather than an approach based on UAN is used to determine which customers are uneconomic. This probabilistic approach is consistent with the approach used in eir’s final 2013/14 USO funding application.

eir is of the view that an approach based on UAN cannot be implemented because uneconomic customers in economic areas cannot be identified based on UANs or by using any other identification number. The UAN identifies only customers’ accounts, but one account may have several lines, lines may move between accounts for example as a result of switching between eir retail and eir wholesale. It is more relevant to identify uneconomic customers by the uneconomic lines than to use the customer account. In

order to populate the model with the data on the revenue distribution, eir has therefore used a combination of STD³⁸ codes and telephone numbers.

eir has indicated that changing from the probabilistic approach is impossible for its final 2014/15 USO funding application due to a lack of required data. According to eir there is no available data on line length measurements for each individual customer. eir states that it is therefore impossible to identify each individual customer's associated revenue and line length cost, and that it is therefore impossible to match revenue and cost data for each customer.

This means that the net cost is not calculated for each individual customer, rather it is based on the probability of a customer being uneconomic, and the corresponding expected net cost.

The main assumption of this approach is that the expected revenue of a customer does not depend on the customer's line length (and hence does not affect the customer's cost). Indeed, the telecoms service that a customer decides to choose and the services he or she uses generally do not depend on the length of their lines.

The approach is implemented by eir in several steps:

- For each MDF, the distribution of customers is calculated over the access cost intervals (for example number of customers whose line costs between €5 and €6) and the net revenue intervals (for example number of customers who pay between €5 and €6);
- For a customer in each net revenue interval, the probability of the customer being uneconomic is calculated: it is calculated by comparing the revenue with the cost distribution. It decreases as the revenue increases: for example, if the revenue of this revenue interval is below cost for all the lines in this MDF, then the probability a line in this revenue interval is uneconomic is equal to 100%.
- Multiplying the probability calculated by the number of customers gives the number of uneconomic customers.
- The expected direct net cost per uneconomic customer for a given revenue interval is estimated as the difference between revenue and the average expected cost for uneconomic customers.

In TERA's view the probabilistic approach adopted by eir is reasonable, absent the availability of more granular line length data that would enable eir to establish individual customer line revenues.

TERA is of the view that the probabilistic approach is consistent with the requirements of Decision 13 as the alternative proposed by eir has the equivalent effect of identifying uneconomic customers in economic areas. It is also in line with Decision 12 as a customer's anticipated revenue isn't correlated to geotype. Moreover, TERA is of the

³⁸ Subscriber Trunk Dialling

view that the parameters and assumptions used by eir in the probability approach are clearly documented and reasoned, as required by Decision 14.

Moreover, TERA is also of the view that following this approach, eir did not include customers who were considered uneconomic but who became economic. Thus, this approach is in line with Decision 10.

TERA's view is based on the following considerations

- UAN relates to a customer's account and not the number of lines on the account and it would not reflect line movement at the customer account level.
- The difficulty in matching revenue and line length information (e.g. where the customer physically moves location and their account changes).
- eir has shown that expected customer revenues and line length costs are not correlated, in other words, there is insufficient data to match individual customer revenue to line length costs.

TERA concludes that the probabilistic approach adopted by eir is reasonable, absent the availability of more granular line length data that would enable eir to establish individual customer line revenues. TERA is of the view that eir's identification of uneconomic customers and its probabilistic approach is in accordance with Decisions 10, 12,13, 14 and 25.

7.2.2. TERA's Assessment of the direct net cost claimed

7.2.2.1. Customer Model Input Changes

eir has used a mixture of the 2009 CAM and the 2016 CAM in its 2014/15 USO Customer Model.

eir has used the 2016 CAM model to produce the cost avoidability inputs it has used in the 2014/15 USO Customer Model. These refer, in particular, to (a) the border of the housing area and (b) the split of costs (capex) between housing areas and isolated areas, by underground/overhead network.

eir has used the 2009 CAM (maintained at the FY 2013/14 level) to calculate the level of avoidability of capex within isolated areas.

eir's final 2014/15 USO funding application documents, did not provide an explanation or rationale for eir's use of the 2016 CAM.

TERA considers that eir's use of the 2016 CAM in its 2014/15 USO funding application is inappropriate, and in particular, its mixed use with elements of the 2009 CAM is incorrect. TERA notes in particular that eir's allocation of costs based on the "Urban/Rural" classifications in the 2016 CAM to the "Housing /Isolated Areas" classifications in the 2009 CAM, is incorrect as these two classifications are not the same and are not directly substitutable.

TERA took eir’s 2013/14 Customer Model “allocation key” inputs and calculations, based on the 2009 CAM, and applied these to eir’s 2014/15 Customer Model worksheets (I_Cost_Alloc and I_Assumptions), as illustrated in Table 1 below.

Using this methodology, TERA estimates that the direct net cost of eir’s 2014/15 Customer Model would decrease by circa €0.53M (i.e. a reduction from €10.92M to €10.39M). This is an approximate estimate. Accordingly TERA has adjusted the direct net cost of the Customer Model by this amount.

Table 12 - Allocation keys to allocate costs to final drop, housing and isolated areas (averaged across the 1064 sites, 2012-2015)

	Overhead				Underground				OH + UG	
	FD HA	FD IA	Non-FD HA	Non-FD IA	FD HA	FD IA	Non-FD HA	Non-FD IA	FD HA	FD IA
2014-15	0%	20%	5%	67%	11%	3%	49%	30%	5%	13%
2013-14	7%	5%	0%	81%	6%	0%	52%	35%	4%	3%
2012-13	7%	5%	0%	81%	6%	0%	51%	35%	4%	3%

Where FD means final drop, HA means Housing Areas and IA means Isolated Areas.

Source: USO Customer Models access 2012-2015 ‘I_Cost_Alloc’, TERA Analysis

7.2.3. Evolution of the customer model net cost

The direct net cost of uneconomic customers increased by 10% in TERA’s final assessment of the 2014/15 USO funding application versus eir’s final 2013/14 USO funding application, as shown in Figure 1.

Figure 1. Direct Net Cost - Uneconomic Customers, €

Source: 2013/14 and 2014/15 Customer Models

Table 13 gives the total number of uneconomic customers and their average direct net cost. While the average direct net cost per uneconomic customer is lower in 2014/15 when compared to 2013/14, the number of uneconomic customers is higher.

Table 13. Number of uneconomic customers and the average direct net cost per uneconomic customer

Source: 2013/14 & 2014/15 Customer Models

Most MDFs contain uneconomic customers: $\frac{\text{X}}{\text{X}}$ of the total number of MDFs. However, for the majority of MDFs the proportion of uneconomic customers is low: $\frac{\text{X}}{\text{X}}$ (see Figure 2).

Figure 2. Proportion of uneconomic customers in economic areas: number of MDF

Source: 2013/14 and 2014/15 Customer Models

7.2.4. Methodological Changes

Other than the mixed use of the 2016 CAM and the 2009 CAM in the USO customer model, there are no other methodological changes in eir's 2014/15 USO customer model compared with eir' final 2013/14 USO funding application customer model.

7.3. Conclusion

TERA considers that eir's use of the 2016 CAM in its 2014/15 USO funding application is inappropriate, and in particular, its mixed use with elements of the 2009 CAM is incorrect. TERA notes in particular that eir's allocation of costs based on the "Urban/Rural" classifications in the 2016 CAM to the "Housing /Isolated Areas" classifications in the 2009 CAM, is incorrect as these two classifications are not the same and are not directly substitutable

TERA is of the view that the TERA adjustment to Customer Model (reflecting the 2009 CAM) is appropriate and in accordance with the requirements of D04/11, in particular Decisions 12, 13, 14 and 25.

8. Payphone Model

8.1. Section Overview

This section reviews the Payphone Model in eir's 2014/15 USO funding application to check that it is in accordance with Decision 16 and 27 of D04/11.

Decision 16: *In respect of mandatory public payphone provision, the net cost calculation shall be based on the total avoidable cost, minus the total revenues foregone. Furthermore, for each public payphone that is connected to a single exchange site, the access cost for a payphone will be the same access cost as that of any line at the exchange site on which it is connected. The avoidable access costs shall be calculated as an estimate per line at the exchange site to which the public payphone is connected. If the number of uneconomic payphones is considered excessive and unreasonable, ComReg may adjust the net cost calculation to reflect appropriate payphone coverage (in areas where they are mandatory).*

Decision 27: *With respect to the provision of public payphones which are "uneconomic", sufficient detail shall be provided on their geographic location and proximity of other public payphones operated by the USP (irrespective of their profitability).*

TERA's assessment is that the calculated direct net cost of the Payphone Model is €129,650.

8.2. Payphone Model Assessment

8.2.1. Methodology

The Payphone Model calculates the cost to eir of providing uneconomic payphones in economic areas. Only those payphones that are subject to USO obligations may be considered as part of the USO net cost. For each USO payphone, the corresponding cost and revenue is calculated.³⁹

The costs include: access costs of the phone line and of WIFI (when relevant, considered to be already captured in the BSA line costs), core cost, cost of printing and selling phone cards, and the cost of payphone maintenance.

The revenues include: all the revenues from the payphone calls, including national and international, WIFI revenue and on TERA's recommendation to eir, any associated payphone advertisement revenue.

The Area Model and changes in the treatment of data, as outlined earlier in this report, impact the Payphone Model as it uses inputs from the Area Model (i.e. average costs per line in an MDF, and whether an MDF is economic or uneconomic).

The Payphone Model has a total of 8 payphones, 1,099 of which are USO payphones (i.e. payphones with unrestricted access, as opposed to payphones on private premises).

³⁹ References to "payphones" in this report are to "USO payphones" unless otherwise stated.

eir in its final 2014/15 USO funding application has included the direct net cost of 8,223 uneconomic USO payphones.

In eir's final 2014/15 USO funding application, the US Payphones direct net cost is €320,223.

An initial additional adjustment has been made by TERA in TERA's assessment of the Payphone Model relating to advertising revenue. The Payphone Model calculates the net cost of uneconomic payphones both, excluding advertising revenue and including advertising revenue. The inclusion of advertising revenues leads to a slightly lower direct net cost and a slightly lower number of uneconomic payphones.

As advertisement revenue is a revenue that wouldn't be obtained by eir in the absence of its provision and service of uneconomic payphones, it is necessary to include this revenue in the direct net cost.

eir chose to exclude the advertising revenue in eir's final 2014/15 USO funding application. TERA considered that eir's approach was incorrect and TERA has included this revenue in the Payphone Model which amounts to €118,117.⁴⁰

This adjustment led to a decrease in the calculated direct net cost of the Payphone Model from €320,223 to €202,106 and a decrease in the number of uneconomic payphones in economic areas from 8,223 to 8,117.

A further adjustment was necessary to take into account ComReg's USO payphone decision in place (Decision D08/14)⁴¹ and, on that basis, to exclude the net cost of a number of payphones that could have been avoided following the change in ComReg's Payphone 'Removal Policy'. This leads to a decrease in the calculated direct net cost of the Payphone Model to €129,650.

8.2.2. TERA's assessment of the direct net cost claimed

TERA's assessment of the calculated direct net cost of uneconomic payphones resulted in a number of reductions to the direct net cost claimed of €320,223, in eir's final 2014/15 USO funding application, to a final estimate of €129,650.

The number of uneconomic payphones remains stable between eir's initial and final applications for 2014/15 (see Table 14 below).

TERA also observes that the net cost of payphones decreased between 2013/14 and 2014/15, and that the number of uneconomic payphones increased while the average net cost per payphone decreased.

⁴⁰ eir confirmed to ComReg by email in May 2017 that it would not disagree with ComReg's decision to include these advertising revenues in the Payphones Model for 2014/15

⁴¹ ComReg (2014), 'Provision of Public Payphones, Universal Service: Scope and Designation', Response to Consultation and Decision, 14/69, 7 July, p.33.

Table 14. Net cost, number of uneconomic payphones and net cost per payphone (€)

Source: Payphone Models 2013/14 and 2014/15

The main factor influencing the change in the direct net cost in the Payphone Model claimed by eir is the change in the number of uneconomic payphones, which decreases between 2013/14 and 2014/15 (€).

TERA has checked for consistency between the results of the Payphone Model and the calculations of the intangible marketing benefit related to payphones, and the results are presented in section 11.4.3. of this report.

eir in its final 2014/15 USO funding application has included the direct net cost of €⁴² uneconomic payphones in economic areas (out of a total of 1099 USO payphones).

Decision 16 of D04/11 sets out that only the net cost of mandatory public payphone provision is relevant to the assessment of the USO funding application. Decision 16 states (emphasis added):

*“In respect of mandatory public payphone provision, the net cost calculation shall be based on the **total avoidable cost**, minus the total revenues foregone. Furthermore, for each public payphone that is connected to a single exchange site, the access cost for a payphone will be the same access cost as that of any line at the exchange site on which it is connected. The avoidable access costs shall be calculated as an estimate per line at the exchange site to which the public payphone is connected. **If the number of uneconomic payphones is considered excessive and unreasonable, ComReg may adjust the net cost calculation to reflect appropriate payphone coverage (in areas where they are mandatory).**”*

The Payphone Model records that eir did not remove any USO payphones during 2014/15. In this regard, the Frontier Report states that:

“In 2009, eir proposed to remove € uneconomic payphones, but objections were made regarding € sites. Therefore € were removed. Most of these were removed before the start of the 2009/10 financial year. Since July 2011, the number of publicly managed payphones has decreased by € payphones to 1,099 in June 2015. As such eir believe a level of payphone deployment has been reached that is not excessive.⁴³”

⁴² As described in section 8.2.1 above, this figure was adjusted downward by TERA to €.

⁴³ Frontier Report, page 123.

TERA notes that, under Decision 16 of D04/11, ComReg may, if necessary, make an adjustment to eir's direct net cost of fulfilling its USO payphone obligations for 2014/15.⁴⁴ Having regard to revenue foregone, any such adjustment could exclude costs which, in ComReg's view eir could have avoided, and which should not, therefore, form part of the calculated direct net cost of the Payphone Model. TERA also notes that Decision 16 specifically refers to the possibility that ComReg may adjust the net cost calculation to reflect appropriate payphone coverage, "[i]f the number of uneconomic payphones is considered excessive and unreasonable".

In 2014, ComReg amended eir's Public Payphones USO designation. In particular, the Removal Procedure was revised as follows⁴⁵:

"The USP is permitted to remove a public pay telephone on a single site where:

- i. there is demonstrable evidence that the removal of the public pay telephone is necessary as the public pay telephone concerned is a focus for anti-social behaviour; or*
- ii. the usage in the previous six months of the public pay telephone (while in reasonable working order) has been low, indicating an absence of "reasonable need" in that location, where "low" is considered to mean:*
 - Average Usage (including local, national, international, emergency calls, DQ calls, Freephone calls and reverse charge minutes) for the previous six months is less than 1 minute per day and*
 - Average minutes for the previous six months to Freephone numbers and Emergency Services combined is not more than 30 seconds of these minutes;*

Or,

- iii. there is more than 1 public pay telephone on the site and the average usage across all of the public pay telephones on the single site does not meet the low usage standards as set out in 4.1(ii); in such instances the USP shall ensure 1 public pay telephone remains on the single site; or*

it is requested by a local authority.

Based on the 2014/15 Payphone Model inputs and additional call detail information requested from eir, an analysis has been performed by TERA to determine, having regard to Decision D08/14, the number of payphones that are appropriate for inclusion in the direct net cost Payphone Model of 2014/15, and the potential impact this may have on the direct net cost of the Payphone Model within eir's 2014/15 USO funding application.

Only criteria (ii) and (iii), as per the decision (D08/14) above, could be analysed based on information in the USO payphone model.

⁴⁴ Eir was designated to provide public payphones for the period from July 2014 to June 2018 in ComReg D08/14 "Universal Service – Provision of Public Payphones: Review of Usage Threshold for Removals", ComReg Document 16/43, Decision 08/14.

⁴⁵ Decision D08/14, File ComReg 14/69, July 7th 2014

eir's final 2014/15 USO funding application payphone model did not identify and clearly break out the breakdown of calls to freefone numbers and the emergency services. Accordingly ComReg requested eir to provide the relevant breakdown for each payphone, which eir provided.

TERA Consultants has analysed the level of adjustment that could have been made based on:

- average usage is less to 1 min per day for a rolling 6-months period (i.e. Month 1 =July 2014 (Revenue distribution per months and per payphone as per the worksheet "I-Revenue" was used to find the monthly usage distribution as this is not included in eir's model and revenues are directly linked to the usage)
- Average freefone calls usage is less than 30 seconds per day for a rolling 6-months period starting July 2014.
- Payphone XY-co-ordinates were also used to determine whether a site is Single or Multiple. If the site is Multiple, the Payphone with the most usage is not removed as per criterion (iii).

Prior to any public payphone removal, eir is required to post a removal notice for the public payphone at least 8 weeks before the removal. This Decision was not published until July 7th 2014. Therefore the earliest that eir could have removed any public payphone was 8 weeks after January 2015 which is 8 months after the commencement of the 2014/15 financial period. Accordingly at least 8/12 of the USO payphone model direct net cost is assumed to have been automatically incurred before first payphones could have been removed.

The analysis shows, based on the threshold set out in Decision D08/14 that  payphones (out of the  claimed by eir) are not allowable as part of the direct net cost within the Payphone Model, the net cost of which could have been avoided by eir in 2014/15. Accordingly, the net cost related to these Payphones have been discounted by the equivalent proportion of months where the payphone should have been removed (i.e. if based on usage scenarios for the 6-month period going from July to December 2014, a Payphone is noticed to be removed in the beginning of January 2015 and set then to be removed 8 weeks after, 4/12 of its direct net cost is disregarded).

This leads to a decrease of the Payphone Model direct USO net cost from €202,106 to €129,650.

Table 15 - Adjustments to the USO PP model net cost for 2014-15

Source: 2014/15 USO models, eir, TERA analysis

8.3. Conclusion

TERA has adjusted eir's final 2014/15 USO funding application Payphone Model calculations, leading to a decrease in the calculated direct net cost of the Payphone Model, to €129,650.

TERA is of the view that in respect to the provision of public payphones which are "uneconomic", sufficient detail was provided by eir on their geographic location and proximity of other public payphones operated by eir (irrespective of their profitability) in accordance with D04/11, and in particular Decision 27.

TERA is of the view that following TERA's adjustments of the Payphone Model in eir's final 2014/15 USO funding application, , the calculations are in accordance with D04/11, and in particular Decision 16.

9. Directories Model

9.1. Section overview

This section reviews the Directories Model element of eir's 2014/15 USO funding application to check that it is in accordance with Decision 17 of D04/11.

Decision 17: *For Directories, the net cost calculation shall use the total avoidable cost, minus total revenues of this service.*

TERA's assessment is that the calculated direct net cost of the Directories Model is €1,400,000.

In 2014/15, eir as USP was required to:

- provide end-users with a comprehensive printed directory of subscribers, free-of-charge, updating it at least once a year.

eir's final 2014/15 USO funding application did not include any costs or revenues of the National Directory Database (NDD) in the Directories Model as the maintenance of the NDD was no longer a requirement of the USO.⁴⁶

With regard to the printed telephone directories, eir has sub-contracted its USO under a commercial agreement with Truvo (business name of FCR Media Limited) ("Truvo") since June 2002. The commercial relationship applicable for 2014/15 is summarised by TERA as follows (having regard to the Frontier Report and further details arising from correspondence with eir in 2017⁴⁷):

- A contract between Truvo and eir dated June 2006, as amended by certain side letters and extended to cover the production of directories for 2014/15 (the "June 2006 contract");
- Truvo has the sole and exclusive rights to publish the White Pages directories on behalf of eir
- Truvo has the sole and exclusive right to sell enhancements in the White pages directory and is entitled to retain all such revenues; and
- Eir is entitled to brand positioning on the covers and to a number of pages in the directories.

The costs and revenues flowing from the June 2006 contract are the basis for the calculation of the net cost of the printed telephone directory of subscribers for 2014/15.

eir has claimed a direct net cost for the Directories Model of €1.4M

⁴⁶ On 19 October 2012 by Direction D10/12, ComReg directed eir to continue to maintain the NDD until 30 June 2014 however this was a separate obligation on the USP.

⁴⁷ Emails received from eir in October and November 2017 subsequent to ComReg requests for further information about Directories revenues and breakdown of eir's annual payments to Truvo.

9.2. Directories Model Assessment

9.2.1. Methodology

The Directories Model in eir's final 2014/15 USO funding application has shown a loss. eir has claimed that the direct net cost of this USO service is €1,400,000.

The costs included in the model relate to an advertising charge paid by eir to Truvo and a contribution to printing and distribution of directories. Based on information provided by eir, TERA is of the view that the Directories USO direct net cost submitted by eir is correct.

9.2.2. TERA's Assessment of the direct net cost claimed

In respect of the printed White Pages directories, following TERA's review of eir's final 2014/15 USO funding application, TERA sought further details and a breakdown of the costs and revenues in the Directories Model.

TERA sought further clarification from eir to explain the absence of revenues from the printed directories service for the 2014/15 period (more specifically when compared to previous USO funding applications). eir provided further information on that matter, specifying the following:

- The annual basic payment, which TERA notes was a major part of revenues in the Directories Model in previous years, was not applicable in 2014/15. This was due to ✂.
- A change to the terms of payment of the minimum advertisement revenues from Truvo to ✂.

In addition, to obtain more details about the costs incurred for the directories service, TERA in particular requested information regarding the advertising charge paid to Truvo in 2014/15.

eir provided additional documentation, ✂.

9.3. Conclusion

TERA is of the view that this assessment is consistent with D04/11 and in particular with Decision 17., TERA's assessment of the direct net cost of the Directories Model for 2014/15 is €1,400,000.

10. Disabled Users' Services Model

10.1. Section Overview

This section reviews the Disabled Users' Services Model element of eir's 2014/15 USO funding application to check that it is in accordance with Decision 18 of D04/11.

Decision 18: *The net cost for the provision of specific USO services for disabled users, shall be calculated using the total avoidable cost minus the associated total revenues foregone. The avoidable cost shall include the cost associated with the provision of USO special services over the standard minimum level of service (e.g. minicom relay services, free directory enquiries, etc) and specialised equipment (e.g. restricted vision phones, inductive couplers, etc) minus the total revenue which is incremental to the total revenue associated with the standard minimum level of service to disabled users (which is appropriate to all operators).*

In 2014/15 eir, as USP, was required to:

- provide a dedicated section of the eir website with information on the services which are of particular interest to people with disabilities
- maintain a Code of Practice concerning the provision of services for people with disabilities
- provide the specific services for users who:
 - are hearing impaired,
 - are hearing and/or speech impaired;
 - have limited dexterity or mobility;
 - have restricted vision; and
 - are unable to use the phone book due to a disability.

TERA's assessment is that the calculated direct net cost of the Disabled Users' Services Model of eir's final 2014/15 USO funding application is €38,833. This figure is the same as the amount eir claimed in its final 2014/15 USO funding application.

10.2. Disabled Users' Services Model Assessment

The results of the direct net cost calculation of services for disabled users are presented in Table 16 (no changes were made between eir's initial 2014/15 USO funding application and eir's final 2014/15 USO funding application).

This obligation comprises the following services provided to disabled users by eir:

- Relay service: Translation of voice message to text and sending of that text to the phone of the customer of the operator and vice versa. In addition to a special rebate (the STEP⁴⁸ rebate).
- Special phones provision: Supply of special phones to disabled customers with dedicated features.

⁴⁸ Scheme for Text Telephone Equality of Payment is provide to account for the additional time it takes to make a text telephone call compared to an ordinary call.

- Free DQ: eir provide free directory enquires for customers that cannot use the phonebook due to a sensory or physical disability or medical condition.
- Braille Provision: reading bills and provision of bills in Braille.

As shown in Table 16, the main change in direct net cost between 2013/14 and 2014/15 is attributable to a general decrease of net cost allocated to each service.

Table 16. Direct net cost of services provided to disabled users

Source: 2013/14 & 2014/15 *Disabled Users' Services Models*

10.3. Conclusion

TERA is of the view that the methodology in eir's final 2014/15 USO funding application Disabled Users' Services Model is in accordance with Decision 18 of D04/11 and that the calculations are correct for each of the following components:

- Text relay;
- Free directory inquiry; and
- Braille bills; and
- specialised equipment.

TERA is of the view that the above approach of calculating costs and revenues is in accordance with D04/11, in particular with Decision 18.

11. Direct Net Cost Overlap with Intangible Benefits Calculations

This section assesses any potential overlap between direct net cost estimates and intangible benefits estimates to ascertain whether there is any evidence of double counting, the avoidance of which is set out in Decision 36 as a key principle in the identification of benefits.

Decision 36: *For the identification of the benefits, ComReg will observe the following key principles:*

- *The benefits represent effects on a USP of providing the USO which have not been accounted for in the direct costing methodology (for example, any benefits that are directly identifiable to specific revenue streams, including indirect and replacement calls revenues are excluded having been covered by the direct net cost calculation).*
- *Avoid the double counting of any benefits.*
- *The benefits are those accruing to the USP, as a consequence of being the designated USP (any benefit arising from the fact that the USP is a large player in the market is to be excluded from the calculations).*

TERA examined each of the four sources of the intangible benefits model, as follows:

- enhanced brand recognition (section 11),
- ubiquity (section 11.2),
- life cycle benefits (section 11.3),
- and marketing benefit (section 11.4).

TERA checked that the input values for the intangible benefits model are correctly sourced from the direct net cost USO model and correspond to the outputs of that model.

TERA also undertook two main exercises to check for overlaps between the direct net cost estimates and the intangible benefits calculations, as required by D04/11 (Decision 36):

- checked that the intangible benefits are not double counting items already accounted for in the direct net cost USO model; and
- checked that the relevant elements are taken into account, either in the direct net cost USO Model, or in the intangible benefits model.

11.1. Enhanced Brand Recognition

11.1.1. Double counting

TERA assessed whether the methodology used to evaluate the enhanced brand recognition benefit could create any double counting issues.

11.1.2. Inputs used to estimate intangible benefits

The enhanced brand recognition model uses inputs from the Area Model.

The data on the number of lines in economic and uneconomic areas used in the enhanced brand recognition model corresponds to the number of lines extracted from the Area Model (table below).

Table 17. Number of lines used to estimate enhanced brand recognition benefit

Source: Area Model 2014/15

Other inputs – economic/uneconomic indicators of areas, number of services for the financial year, annual revenue from access services, one-off revenue from access services, revenue from core network services, avoidable costs from access services, and avoidable costs from core network services – have also been extracted correctly from the Area Model.

11.1.3. Conclusion

TERA considers that there is no double-counting between the direct net cost USO model and enhanced brand recognition model, and the inputs to the enhanced brand recognition model are extracted correctly.

11.2. Ubiquity

11.2.1. Double counting

TERA assessed whether the methodology used to evaluate the ubiquity benefit could create any double counting issues.

11.2.2. Inputs used to estimate intangible benefits

The ubiquity model uses inputs from the Area Model.

The data on the number of lines in economic and uneconomic areas used in the ubiquity model corresponds to the number of lines extracted from the Area Model (table below).

Table 18. Number of lines used to estimate ubiquity benefit

Source: Area Model 2014/15

Other inputs – economic/uneconomic indicators of areas, number of services for the financial year, annual revenue from access services, one-off revenue from access services, revenue from core network services, avoidable costs from access services, and avoidable costs from core network services – have also been extracted correctly from the Area Model.

11.2.3. Conclusion

TERA is of the view that there is no double-counting between the direct net cost USO model and ubiquity model, and the inputs to the ubiquity model are extracted correctly.

11.3. Life Cycle Benefits

11.3.1. Double counting

Life cycle benefits consist of two components:

- 1) benefit from uneconomic areas becoming economic,
- 2) benefit from uneconomic customers becoming economic.

TERA considers that there is no double counting between the direct net cost USO model and the life cycle benefits model.

11.3.2. Inputs used to estimate intangible benefits

eir explains that in order to estimate the benefit related to uneconomic areas the Area Model is run two times: with the life-cycle mark-up benefit parameter equal to 0% and to ∞ . The difference between two results corresponds to the life cycle benefit. TERA has checked how the results of the Area Model change with the change of the parameter (see Table 18 below).

Table 19. An extract from the parameters of the Area Model

Modelling / financial year	2014 / 2015
Currency unit	EUR
Cost of capital	8,18%
Days in a year	365
Days in a month	30,42
Life-cycle benefit factor	0,00%

Source: 2014/15 Area Model

TERA confirms that the direct net cost of uneconomic areas is equal to €311,027 when the parameter is set to zero and to €307,257 when the parameter is set to ∞ (see table below). The numbers used as inputs for the calculation of life cycle benefits relating to uneconomic areas are therefore correct.

Table 20. Area Model results without and with life cycle mark-up

Estimated net cost from the Area Model (without mark-up)	€ 311 027
Estimated net cost from the Area Model (with mark-up)	€ 307 257

Source: Oxera Intangible Benefits Report 2014/15

11.3.3. Conclusion

TERA is of the view that there is no double-counting between the direct net cost USO model and the life cycle model, and the inputs to the life cycle model are extracted correctly from the Area Model.

11.4. Marketing Benefits

11.4.1. Double counting

Marketing benefit is calculated as an intangible advertising benefit that eir derives from corporate branding or logo display on USO payphones.

11.4.2. Inputs used to estimate intangible benefits

As explained in section 8, the number of uneconomic USO payphones is 8 in 2014/15. The total advertisement revenue from third party advertising on these payphones equals to 8. This advertisement revenue is included in the direct net cost.

11.4.3. Conclusion

TERA considers that there is no double-counting between the direct net cost USO model and the intangible marketing benefits model, and the inputs to the marketing benefits model (after calculating the net cost including advertising revenues) are extracted correctly from the Payphone Model.

11.5. Conclusion

The inputs of the intangible benefits models correspond to the outputs of the direct net cost models.

There is no double-counting between the direct net cost USO Models and the intangible benefits models, therefore TERA is of the view that the calculated direct net cost in eir's final 2014/15 application is in accordance with the principles set out in Decision 36 of D04/11.

TERA is of the view that the inputs of the intangible benefits model correspond to the outputs of the direct net cost USO models.

TERA is also of the view that there is no double counting between the direct net cost and the intangible benefits, in accordance with Decision 36.

12. Appendix 1: Referenced Decisions in ComReg D04/11 “Costing of universal service obligations: Principles and Methodologies”, 31 May 2011

Decision 1

Decision 1: The HCA methodology, properly adjusted for efficiencies and taking account of the costs that could have been avoided by the USP without having the USO, is the cost methodology that must be used to calculate the net cost of the USO.

Decision 2

Decision 2: USO net costs shall be calculated on the basis of “all” capital costs and “all” operating costs that could be avoided on a HCA basis, as if the provision of services to uneconomic customers by a commercial operator was not required under a USO. It is only the portion of costs, both capital and operational expenditure for the given financial year, that can be directly attributed to the USO service (i.e. the service activity creates the cost) and which could have been avoided without the USO, which are included in the net cost calculation.

Decision 3

Decision 3: USO revenues shall be calculated on the basis of both the direct and indirect revenues that an operator would forego as a result of ceasing to provide services to uneconomic customers.

Decision 4

Decision 4: Direct revenues shall include those revenues which are directly invoiced to a customer for the services provided directly by the USP. They include:

- One-off connection charges: where the revenue should be allocated over the expected life of the customer. In circumstances where a line is permanently disconnected, the remaining unallocated one-off connection charges should be allocated to that year of disconnection;
- Revenues associated with access (e.g. line rental);
- Calls (e.g. local, national, mobile, international, directory enquiries (“DQ”) and premium rate services); and
- Complementary services, such as, broadband services.

Decision 5

Decision 5: Direct revenues shall include those revenues from an OAO (who is indirectly providing the service to the customer) using the USP’s wholesale services and include, amongst other things:

- Wholesale access (single billing wholesale line rental (“SB-WLR”));
- Wholesale calls; and
- Complementary wholesale services, such as Bitstream and Local Loop Unbundling (“LLU”) etc.

Decision 6

Decision 6: Indirect revenues shall include those revenues which are not directly invoiced to a customer for the services provided directly by the USP. They include:

- Wholesale interconnection revenues: fixed termination and transit services as a result of inbound calls from another fixed / mobile networks, where an OAO is invoiced for terminating and transiting a call on the USP network;
- Non-geographic numbers (e.g. 1800, 1850, 11811 and 1890 numbers);
- Economic USO customer calls to an uneconomic customer: firstly, the revenue of the economic customers' calls to uneconomic customers shall be allocated to the uneconomic customer. If the uneconomic customer is now economic, as result of the allocation, then a second stage is required to ensure that this treatment does not make the previously economic customer into an uneconomic customer as a result. If as a result of this second stage the economic customer becomes uneconomic, then it is only that portion of revenue which the economic customer can spare without making themselves uneconomic that should be allocated;
- Leased Lines: where initially all revenues associated with the leased line are allocated to the uneconomic line. If the uneconomic point is now economic, as a result of the allocation, then a second stage is required to ensure that this treatment does not make the previously economic point into an uneconomic point as a result. If as a result of this second stage the economic point becomes uneconomic, then it is only that portion of revenue which the economic point can spare without making themselves uneconomic should be allocated; and
- Replacement calls: where a net cost exists, replacement calls shall be estimated and added to the net cost calculation (but only in circumstances where "uneconomic" areas or customers have been firstly identified as commercially uneconomic).

Decision 7

Decision 7: Where it is clearly demonstrated that due to a lack of information beyond the control of the USP, that it is not practicable for indirect revenues to be calculated in accordance with Decision No. 6, the USP may use an alternative approach, provided that it is properly supported with reasonable assumptions.

Decision 8

Decision 8: The avoidable costs included in the net cost calculation, shall be those costs reflecting the provision of the USO which a commercial operator would not ordinarily have provided, and which were incurred in the most efficient way. These costs shall relate to: (a) the avoidable capital costs associated with CAPEX i.e. depreciation; (b) OPEX; and (c) overheads for the appropriate financial year.

Decision 9

Decision 9: ComReg may use a number of methodologies to determine the appropriate level of costs that would have been incurred by an efficient operator, in order to determine the quantum of adjustments necessary to the USP's net cost calculation. These methodologies may include, but are not limited to, the use of:

- The review of supporting documentation available, such as: cost-benefit analysis reports; engineering reports; fault reports of geographical areas, and other documents in relation to the business case / investment decisions associated with the network roll-out and upgrade;
- A line fault efficiency rate: applying the national LFI target rate (corresponding to the financial year in question) at a regional level (and allowing for appropriately reasoned variances) ;
- Independent survey report regarding the USP's efficiency;
- Regulatory decisions from other jurisdictions that provide relevant precedents and benchmarks; and
- The development of a model to assess the appropriateness of the efficiency adjustment proposed by the USP.

Decision 10

Decision 10: The net cost calculation shall not include those customers who were originally considered "uneconomic" but who have now become profitable. The net cost calculation also does not include those customers attained as a direct result of a competitive tendering process (who are deemed "uneconomic").

Decision 11

Decision 11: Uneconomic areas shall be identified at an MDF level.

Decision 12

Decision 12: An average depreciation charge for each class of network element (based on an average cost and asset age) shall be developed by geo-types (e.g. urban, sub-urban, rural etc.). The USP may allocate the relevant depreciation charge (as reconcilable to the HCA accounts and taking account of the principle of avoidable costs) for each exchange area based on the asset requirements as determined by the Copper Access Model (as updated or similar modelling tool). The calculation must be sufficiently granular to allocate costs only to those network elements actually used by users who are potentially uneconomic. In making this allocation, the USP should draw on, and be prepared to substantiate its investment profile / decision making, works-orders etc., so as to ensure that the allocation is appropriate (i.e. the USP should satisfy itself that in making an allocation to an MDF area, it has not allocated costs which are not reflective of the USP's investment profile in that MDF area).

Decision 13

Decision 13: Uneconomic customers in economic areas shall be identified based on universal account numbers (“UANs”). However, if ComReg is satisfied, because of a lack of information beyond the control of the USP, that it is not practicable to identify uneconomic customers by UAN, the USP must demonstrate that the use of an alternative approach has the equivalent effect of identifying those customers.

Decision 14

Decision 14: The USP may calculate uneconomic customers in economic areas using a probability analysis. However, the identification and allocation of these costs must be consistent with ComReg’s decision outlined in Decision No. 12.

The parameters and assumptions used in the probability analysis must be clearly documented and duly reasoned as to the circumstances why the USP considers the customer uneconomic.

Decision 15

Decision 15: During the course of ComReg’s assessment of a USO funding application, a number of sample “reality” checks will be undertaken. If material discrepancies are found, ComReg may: require a full assessment for those exchange areas claimed to be uneconomic or include uneconomic customers; apply a proportionate adjustment to the net cost calculation (pre-intangibles); or reject the entire USO funding application (on the basis that the discrepancy is of a magnitude which would render the application not fit for purpose).

ComReg as part of its assessment process, will reserve the right to further interrogate any rationale provided by the USP in relation to uneconomic areas and uneconomic customers and to undertake its own assessment regarding the appropriateness of these net costs.

Decision 16

Decision 16: In respect of mandatory public payphone provision, the net cost calculation shall be based on the total avoidable cost, minus the total revenues foregone. Furthermore, for each public payphone that is connected to a single exchange site, the access cost for a payphone will be the same access cost as that of any line at the exchange site on which it is connected. The avoidable access costs shall be calculated as an estimate per line at the exchange site to which the public payphone is connected. If the number of uneconomic payphones is considered excessive and unreasonable, ComReg may adjust the net cost calculation to reflect appropriate payphone coverage (in areas where they are mandatory).

Decision 17

Decision 17: For Directories, the net cost calculation shall use the total avoidable cost, minus total revenues of this service.

Decision 18

Decision 18: *The net cost for the provision of specific USO services for disabled users, shall be calculated using the total avoidable cost minus the associated total revenues foregone. The avoidable cost shall include the cost associated with the provision of USO special services over the standard minimum level of service (e.g. minicom relay services, free directory enquiries, etc) and specialised equipment (e.g. restricted vision phones, inductive couplers, etc) minus the total revenue which is incremental to the total revenue associated with the standard minimum level of service to disabled users (which is appropriate to all operators).*

Decision 19

Decision 19: *USO funding applications shall be consistent and in accordance with this Decision and Decision Instrument.*

Decision 20

Decision 20: *USO funding applications shall be fit for purpose.*

Decision 21

Decision 21: *USO funding applications shall be based on annual information which coincides with the USP's financial year.*

Decision 22

Decision 22: *A declaration shall be signed off by the Board of Directors of the USP and it must accompany the application. (The required declaration is included in Schedule 1). Financial information shall be provided with an appropriate audit opinion or appropriate report, where the Auditor⁷³ (as approved by ComReg) has in no way assisted with the preparation of the USO funding application.*

Decision 23

Decision 23: *USO funding applications shall be supported by calculations in an MS Excel, or MS Access format, or alternative software which is reasonably capable of proper access and review.*

Decision 24

Decision 24: *Any models submitted in support of a USO funding application shall be transparent: there must be limited hard-coded cells (where cells are hard-coded a supporting reference document of such numbers must be provided and be capable of being reconciled and audited) and all numbers must be set out so that there is an audit trail present. The models submitted shall be set out in a clear and transparent manner, showing the separate calculations for each component (e.g. uneconomic areas, uneconomic customers, the provision of public pay telephones and specific services for disabled users). The calculations supplied must clearly set out the capital costs, operating costs, overheads, etc (including General and Administration — ("G&A") costs) and the methods adopted for the allocation of costs which are not directly related to the provision of the USO. Where uneconomic lines/areas are identified, the works orders associated with those areas for the year of assessment must be available upon request by the Auditor as supporting documentation for the USO application.*

Decision 25

Decision 25: Applications shall, with reference to the supporting model clearly identify (by MDF or by geographic location as appropriate), with adequate reasoning and cogent evidence to justify that, those customers or groups of customers (i.e. area), that in the absence of the USO, the provision of the service would either not continue to be provided or would never have been provided, to that customer or groups of customers (i.e. area) by a commercial operator, or by the USP acting as a commercial operator. The USP must provide its commercial reasoning, including the respective parameters used in justifying its decision, including, but not limited to:

- The current loss-making status of those customers or areas;
- The local density of those customers or areas;
- The respective distances from exchange for uneconomic customers;
- The network infrastructure / technology used to serve those customers or areas; and
- Any other pertinent information the USP has used to influence its decision making process.

Furthermore, applications must not include those customers attained through a competitive tendering process, or those customers which have now become economic, but who were previously considered uneconomic.

Decision 26

Decision 26: There may be a requirement to make certain key data / workings publicly available and the USO funding application is deemed to be made by the USP on this understanding.

Decision 27

Decision 27: With respect to the provision of public payphones which are “uneconomic”, sufficient detail shall be provided on their geographic location and proximity of other public payphones operated by the USP (irrespective of their profitability).

Decision 28

Decision 28: The model provided shall be supported by comprehensive documentation, clearly setting out and explaining all inputs (both financial and otherwise), efficiency adjustments applied, engineering rules applied, cost allocation methodologies employed, depreciation methodologies applied and assumptions made.

Decision 29

Decision 29: Sampling may be used for certain aspects of the modelling of net cost, for example the assumptions driving the size of replacement calls. Where sampling is used, samples must be sufficiently representative of the population being sampled. Where applicable, any application of a sampling methodology by the USP must accord with ComReg Decision D07/10.

Decision 30

Decision 30: USP funding applications shall, where applicable, accord with ComReg Decision No. D07/10 in relation to accounting separation.

Decision 31

Decision 31: The calculation of the benefits of the USO shall be completed by an external expert, independent of the USP. These calculations must clearly set out: the respective methodologies; assumptions and supporting documentation used at deriving the benefits of the USO.

These calculations must provide: (a) the benefit (in monetary terms) that the USP derives as a commercial operator; (b) the benefit (in monetary terms) that the USP derives as a result of the USO; and (c) a reconciliation with reasoning to explain the incremental difference between (a) and (b).

Decision 32

Decision 32: Eircom, the current USP, may submit a request for USO funding to ComReg in respect of its financial period 1 July 2009 to 30 June 2010. If Eircom intends to submit such a request to ComReg, it shall do so no earlier than 1 month, and no later than 6 months following the date of this Decision. ComReg may extend this deadline, but only where it considers that there are exceptional reasons for doing so.

Decision 33

Decision 33: Subsequent requests for USO funding by a USP(s) may be submitted to ComReg in respect of a relevant financial year. If a USP intends to submit such a request to ComReg, the USP(s) shall do so no later than 9 months following the end of the financial year in respect of which the request is intended to be made. ComReg may extend this deadline, but only where it considers that there are exceptional reasons for doing so.

Decision 34

Decision 34: ComReg Document No. 07/39 dated 2 July 2007 and entitled "The Provision of the Universal Service: Request for Funding by Eircom", is hereby revoked in its entirety.

Decision 35

Decision 35: The net cost calculation must assess the benefits, including intangible benefits, to the USP. ComReg will consider, at a minimum, the following benefits (as a result of the USO) for a USO net cost calculation:

- Brand Recognition.
- Ubiquity.
- Life-cycle.
- Marketing.

Decision 36

Decision 36: *For the identification of the benefits, ComReg will observe the following key principles:*

- *The benefits represent effects on a USP of providing the USO which have not been accounted for in the direct costing methodology (for example, any benefits that are directly identifiable to specific revenue streams, including indirect and replacement calls revenues are excluded having been covered by the direct net cost calculation).*
- *Avoid the double counting of any benefits.*
- *The benefits are those accruing to the USP, as a consequence of being the designated USP (any benefit arising from the fact that the USP is a large player in the market is to be excluded from the calculations).*
